About Centrify Management Services for Mac

With Centrify Management Services for Mac, you can use Active Directory to centrally manage authentication, policy enforcement, single sign-on (SSO), and user self-service for popular endpoint devices running Mac operating systems.

A key component of Centrify Management Services for Mac is the *Centrify agent* for Mac computers. You must install the agent on each computer that you want to integrate with Active Directory and manage through Centrify Access Manager.

After you install the agent on a Mac computer, you can perform many administration and configuration tasks on the computer to enable the computer to work with Centrify Management Services and with Active Directory.

Intended audience

This guide is intended for Mac system administrators.

Topic covered in this guide

The *Administrator's Guide for Mac* provides information about the administration and configuration tasks that you perform on a Mac computer after you install the agent so that you can manage users, groups, computers, and zones with Access Manager. Additional topics, such as installing the agent, optionally enrolling the computer in the Centrify identify platform, and troubleshooting issues after the agent is installed are also covered.

Specific areas of focus are as follows:

- This guide provides installation instructions and step-by-step instructions for configuring Mac computers to join an Active Directory domain through Auto Zone, which essentially creates one large zone for all Mac computers. Auto Zone requires minimal configuration and is appropriate for most Mac environments. If your environment is larger, or more complex, and doesn't easily fit into Auto Zone, you must consult the *Planning and Deployment Guide* for detailed information on how to move your Mac users and computers to Active Directory and use Centrify zones to structure your environment.

- This guide describes how to enroll a Mac computer in the Centrify identify platform. You can enroll a Mac computer in the Centrify identify platform during, after, or instead of agent installation. That is, a Mac computer can be managed by just the agent (in which case it is joined to a domain), just the Centrify identify platform, or both. Both the agent and the Centrify identify platform enable the computer to be managed through Active Directory and group policies.

If the computer is managed through both the agent and the Centrify identify platform, it can be viewed and managed through both the Centrify Access Manager console and the Centrify user portal. In this scenario, a single computer object is created in an Active Directory container of your choosing.

- This guide explains how to handle issues and tasks that are specific or unique to a Mac environment.

Note If you choose to enroll a Mac computer in the Centrify identify platform as described in this document, you should consult the Centrify Management Services for Mac online help for information about cloud-specific configuration and administration tasks.

This guide does not cover planning or Access Manager tasks handled through the Access Manager console. For more information about those topics, see [Where to go for more information](#).

This guide assumes you have a working knowledge of performing administrative tasks in a Mac environment.

Documentation conventions

The following conventions are used in Centrify documentation:

- Fixed-width font is used for sample code, program names, program output, file names, and commands that you type at the command line. When *italicized*, this font indicates variables. Square brackets ([]) indicate optional command-line arguments.
- **Bold** text is used to emphasize commands or key command results; buttons or user interface text; and new terms.
- *Italics* are used for book titles and to emphasize specific words or terms. In fixed-width font, italics indicate variable values.
- Standalone software packages include version and architecture information in the file name. Full file names are not documented in this guide. For complete file names for the software packages you want to install, see the distribution media.
- For simplicity, UNIX is used to refer to all supported versions of the UNIX and Linux operating systems. Some parameters can also be used on Mac OS X computers.

Finding more information about Centrify products

Centrify provides extensive documentation targeted for specific audiences, functional roles, or topics of interest. If you want to learn more about Centrify and Centrify products and features, start by visiting the [Centrify website](#). From the Centrify website, you can download data sheets and evaluation software, view video demonstrations and technical presentations about Centrify products, and get the latest news about upcoming events and webinars.

For access to documentation for all Centrify products and services, visit the [Centrify documentation portal](#) at docs.centrify.com. From the Centrify documentation portal, you can always view or download the most up-to-date version of this guide and all other product documentation.

Contacting Centrify

You can contact Centrify by visiting our website, www.centrify.com. On the website, you can find information about Centrify office locations worldwide, email and phone numbers for contacting Centrify sales, and links for following Centrify on social media. If you have questions or comments, we look forward to hearing from you.

Getting additional support

If you have a Centrify account, click Support on the Centrify website to log on and access the [Centrify Technical Support Portal](#). From the support portal, you can search knowledge base articles, open and view support cases, download software, and access other resources.

To connect with other Centrify users, ask questions, or share information, visit the [Centrify Community](#) website to check in on customer forums, read the latest blog posts, view how-to videos, or exchange ideas with members of the community.

Installing the Centrify agent and joining a domain

This topic provides step-by-step instructions for installing the Centrify agent on a Mac computer and joining it to an Active Directory domain. This is required to use Active Directory to centrally manage authentication, policy enforcement, single sign-on (SSO), and user self-service for Mac devices.

The following topics are covered:

- [Preparing to install the Centrify agent](#)
- [Installing the Centrify agent](#)
- [Joining an Active Directory domain](#)
- [Logging on to the Mac after joining a domain](#)
- [Upgrading the Centrify agent](#)

Preparing to install the Centrify agent

You must install the Centrify agent on each computer that you want to manage through Centrify and Active Directory. You can check the *Release Notes* included with the software, or visit the [Centrify Web site](#) (scroll to **Supported Platforms** and click the **Details** tab) to verify that each computer where you plan to install is running a supported version of the mac operating system.

Note The installation package also contains a utility, ADCheck, which verifies that each of your Mac computers is ready for installation of the Centrify agent. ADCheck confirms that a computer is running a supported OS, has sufficient disk space to install the Centrify agent, and that the domain you intend to join has functioning domain

• • • • •

Note controllers and DNS servers. Information about running ADCheck is included in the [installation instructions](#).

Verifying Centrify agent installation prerequisites

Before installing the Centrify agent on your Mac computers, be certain that you or another administrator has installed Centrify Infrastructure Services on a Windows computer in the domain. Centrify Infrastructure Services includes the Access Manager Console, which is the primary management console for performing ongoing operations, including the application of group policies. Always install this console unless you are installing and running Centrify Express for Linux, UNIX and Mac, which does not contain a console component.

For information about other Centrify Infrastructure Services components, such as Deployment Manager and Zone Provisioning Agent, which are useful in mid-size to large deployments, see the *Planning and Deployment Guide* and the *Administrator's Guide for Linux and UNIX*.

Deciding when and how to join a domain

Following installation, you will be prompted to join a domain. Whether to join a domain depends primarily on how you intend to join. Centrify provides two ways to join a domain:

- Through Auto Zone, which is the recommended method for installations with 1500 or fewer users. When joined through Auto Zone, all users and groups defined in Active Directory for the forest — as well as all Active Directory users defined in a forest with a two-way, cross-forest trust relationship to the forest of the joined domain — automatically become valid users and groups on the Mac computer.
- By connecting to a specific Centrify zone, which is the recommended method for installations with 1500 or more users, or for installations in which fine-tuned access control is needed. A zone is similar to an Active Directory organizational unit (OU) and allows you to organize the computers in your organization in meaningful ways to simplify account and access management and the migration of information from existing sources to Active Directory.

The assumption of this guide is that you are joining Auto Zone. After installation, you can follow the instructions to join the domain and with a few configuration steps all of your Active Directory users will be able to log into this computer.

Note If you have a set of Apple Open Directory users, you should migrate them following installation but before joining a domain.

On the other hand, if your environment requires a zone structure, you must create that structure before joining a domain. Therefore, after installing the Centrify agent, consult the *Planning and Deployment Guide* and the *Administrator's Guide for Linux and UNIX*, which explain in detail how to plan, create, and maintain an Active Directory installation of non-Windows computers with Centrify Infrastructure Services.

Installing the Centrify agent

The Centrify agent for Mac computers can be installed in several different ways. The procedure in this section shows how do so by double-clicking the Centrify Installer package (DMG) and following the instructions displayed on the screen. This installation method is recommended for most users when installing on a single computer or a limited number of computers.

When you use the Centrify package installer, you will be prompted to join the domain. You may also join the domain after installation using either the `adjoin` command-line program or the Centrify Directory Access plug-in.

Centrify provides a number of other ways to install the Centrify agent:

- By executing the Centrify installation script, `install.sh` in a Terminal window on a Mac computer and following the instructions displayed by the script.

If you are an experienced UNIX administrator and are familiar with UNIX command-line installations, running `install.sh` is a good method to use. When you install using the `install.sh` script, you can automatically join an Active Directory domain as part of the installation process; see [Installing using the `install.sh` script](#) for details.

- By installing remotely, without user interaction, using Apple Remote Desktop. This is a good method to use if you are generally using Apple Remote Desktop for software distribution. With Apple Remote Desktop

you can add pre- and post-installation scripts that allow you to join the remote computer to a domain after installation; see [Installing silently on a remote computer](#) for details.

- By installing remotely with Deployment Manager. Deployment Manager runs as a Windows Console and allows you to analyze a non-Windows computer, download the appropriate version of the Centrify agent from the Centrify Download Center, and install it on the target computer. This installation method is recommended for larger installations in which you must install the Agent on multiple Mac computers. See the *Planning and Deployment Guide* and the *Deployment Manager User's Guide* for more information.

To install the Centrify agent on a Mac computer using the graphical user interface:

Before installing the Centrify agent, disable Apple's built-in Active Directory plug-in, and remove Active Directory from the Authentication, and Contacts search paths. For more information, see [Disabling Apple's built-in Active Directory plug-in](#).

In addition, be certain that the Apple Directory Utility is closed.

1. Log on with the Administrator account.
2. Navigate to the directory on the CD or your local network where the Centrify agent package is located. For example, if you are installing from the Centrify CD, open the macOS directory.

3. Double-click the DMG file, for example:

```
centrifydc-release-mac10.10-x86_64.dmg
```

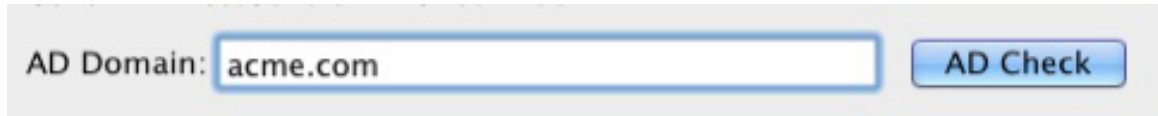

4. Double-click ADCheck to open the ADCheck utility.

ADCheck performs a set of operating system, network, and Active Directory checks to verify that the Mac computer meets the system

requirements necessary to install the Centrify agent and join an Active Directory domain.

5. Enter the domain you intend to join with the Mac computer and click **AD Check**; for example:

A screenshot of a software interface showing a text input field labeled "AD Domain:" containing the text "acme.com". To the right of the input field is a blue button labeled "AD Check".

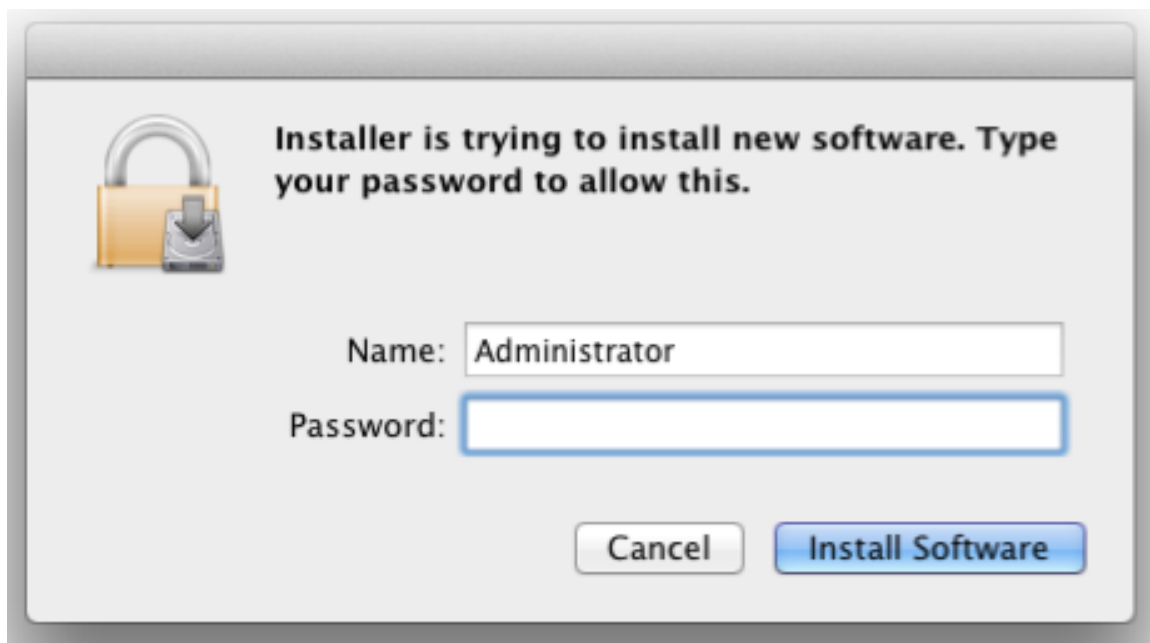

6. Review the results of the checks performed. If the target computer, DNS environment, and Active Directory configuration pass all checks with no warnings or errors, you should be able to perform a successful installation and join the specified domain. If you receive errors or warnings, correct them before proceeding with the installation; see the *Administrator's Guide for Linux and UNIX* for more information about ADCheck.
7. Double-click the CentrifyDC package to open the Installer:

Install

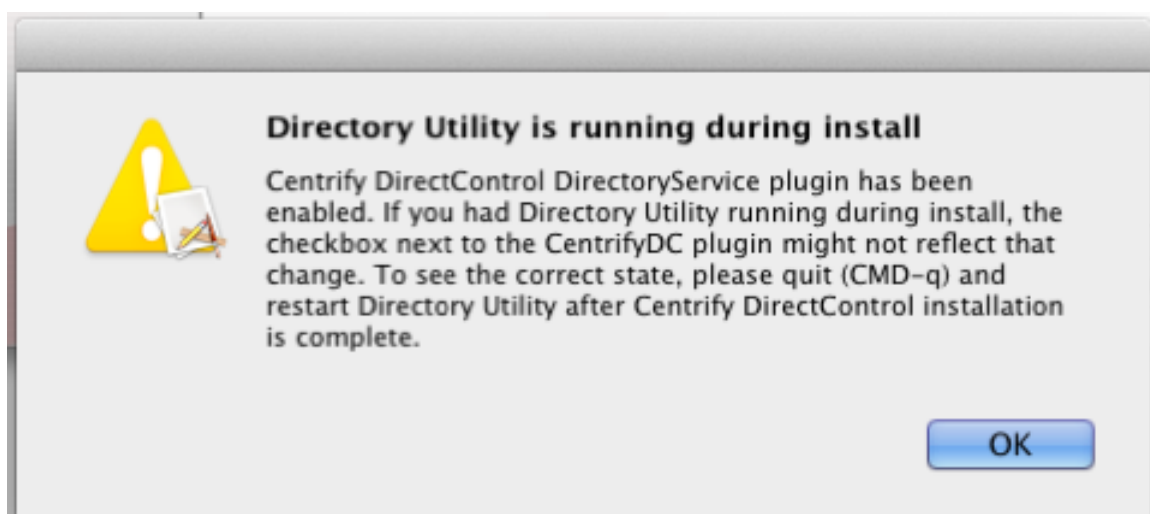

CentrifyDC-5.4.0-x86_64

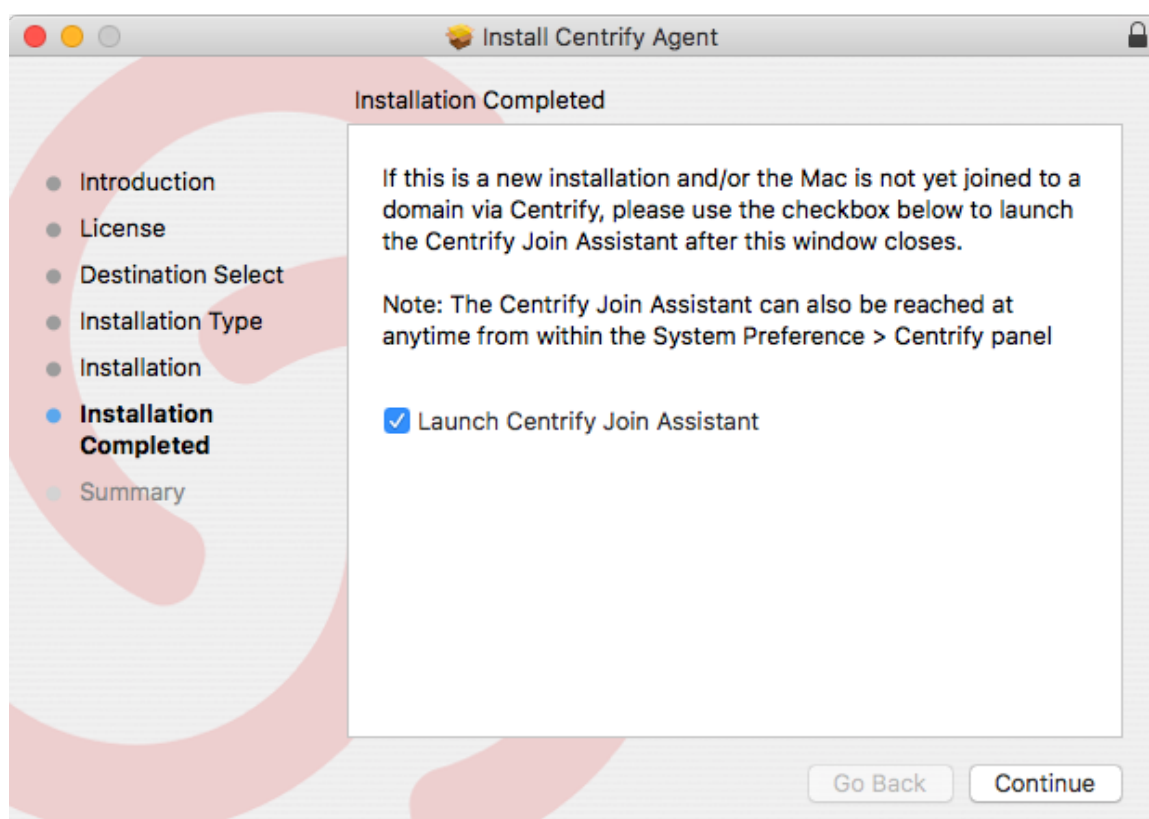

8. Review the information in the Welcome page, then click **Continue**.
9. Review or print the terms of the license agreement, then click **Continue**; click **Agree** to agree to the terms of the license agreement. Then click **Install** (note that you cannot change the volume on which the agent is installed — it must be on the same volume as Mac OS X).
10. If prompted, enter the administrator name and password, and click **Install Software** to install the Centrify agent.

If you see the following warning box, click **OK**. If you did not have Directory Utility running during the installation, you can ignore the warning. If Directory Utility was open, you can quit and restart it to show the correct status of the Centrify plug-in.

The installation process runs and presents the Installation Completed page once the Centrify agent is installed.

11. Select **Launch Centrify Join Assistant** if you want to join a domain, then click **Continue**.

Note If you know that you want to use Centrify zones in your environment, exit the installer now. You must create zones first, before you can join to one. Refer to [Deciding when and how to join a domain](#) for more information.

If you chose not to launch the Centrify Join Assistant before clicking Continue, the installer presents a summary indicating that the installation was successful. You can now close the installer.

If you chose to launch the Centrify Join Assistant, you can start the process of [Joining an Active Directory domain](#).

Joining an Active Directory domain

This topic shows how to use the Centrify Join Assistant to join a domain. To join a domain, you must be a domain admin or a domain user with permission to create computer objects. If necessary, your domain administrator can use the Delegation Wizard to delegate permission to create computer objects. Refer to <https://blogs.technet.microsoft.com/dubaisec/2016/02/01/who-can->

• • • • •

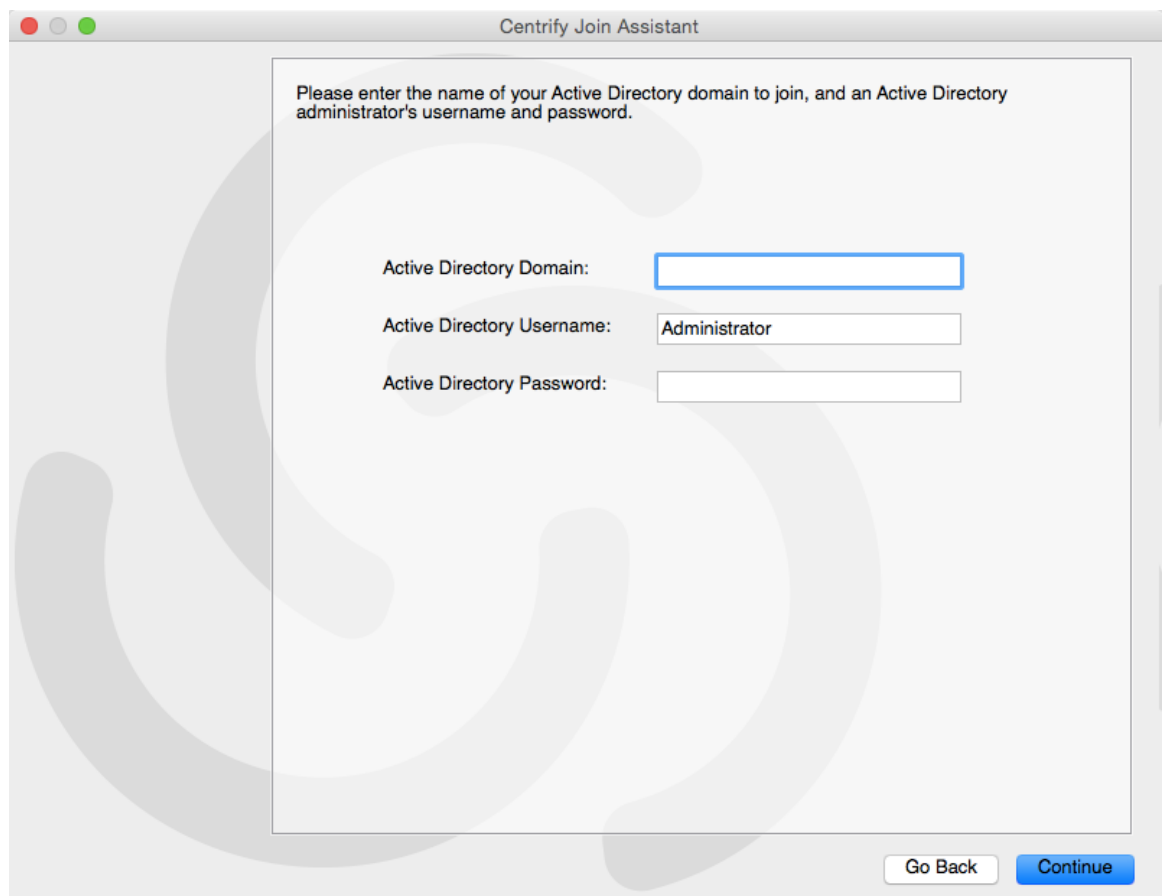

[add-workstation-to-the-domain/](#) for more information about joining workstations to a domain.

Note Alternately, you may run the `adjoin` command-line utility, interactively or in a script, for each Macintosh computer you want to add to a domain in the forest. See the *Administrator's Guide for Linux and UNIX* for details.

1. Launch the Centrify Join Assistant.

There are two ways to launch the Centrify Join Assistant:

- from the Centrify agent installer, as described in [Installing the Centrify agent](#)
- click **Applications > Utilities > Centrify**, double-click **Centrify Join Assistant** to open it, then click **Continue** on the Welcome page

Centrify Join Assistant

Please enter the name of your Active Directory domain to join, and an Active Directory administrator's username and password.

Active Directory Domain:

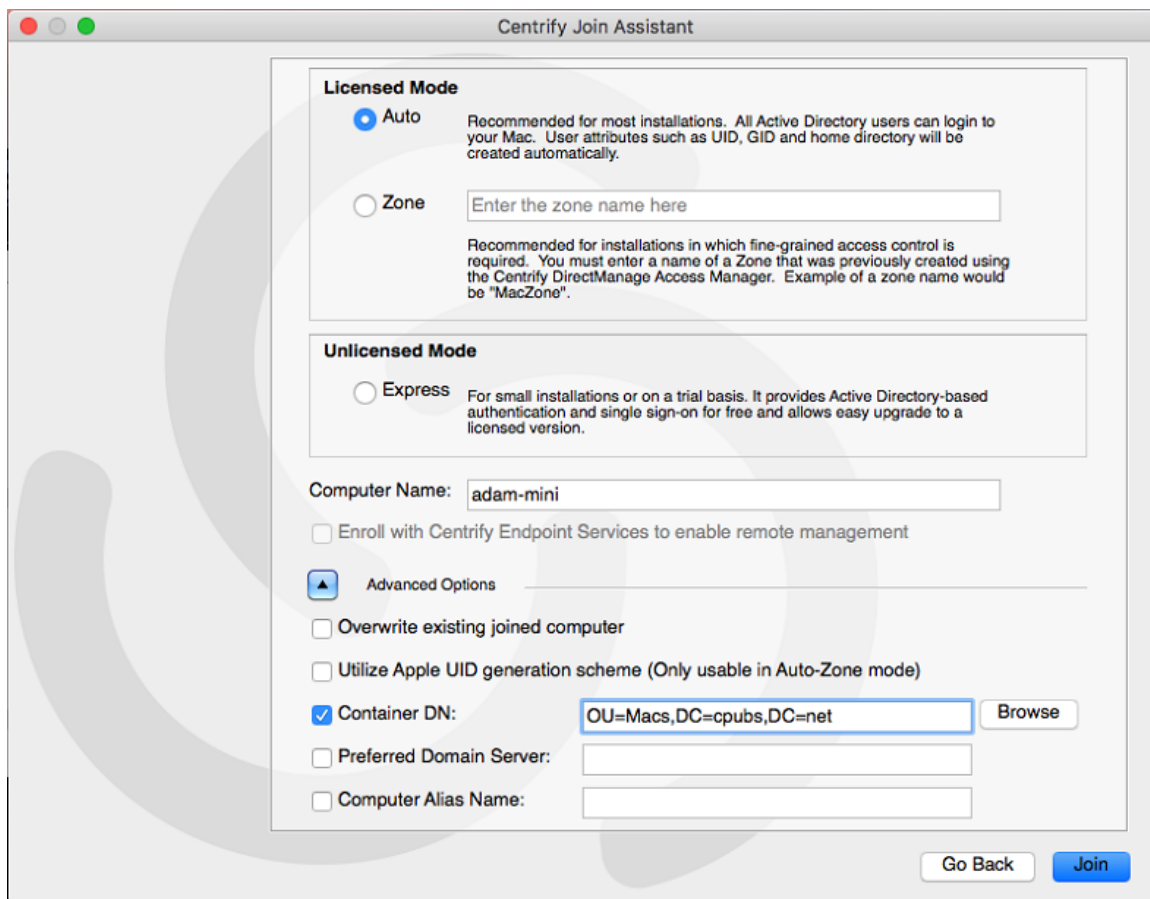

Active Directory Username:

Active Directory Password:

Go Back Continue

2. Enter the active directory domain that you want to join as well as administrator credentials for that domain, then click **Continue**.

A page appears that allows you to select how to join the domain with an option to enroll in the Centrify Identity Services.

3. Select from the following options:

Select this option	To do this
Express	Joins a domain using a free version of Centrify called Centrify Express that does not include licensed features, such as group-policy enforcement, zone-based access control, and smart card login to Active Directory.
Auto	Joins the computer through Auto Zone, which allows joining a computer with little or no configuration. This option is recommended for most installations.
	Joins to the zone that you type in the box. Note that you must have created at least one zone before you can use this option.
Computer name	Defaults to the name of the computer on which you are running the join assistant, but you can change it if you want to use a different name for the local host in Active Directory.
Enroll	Provides an opportunity to download the Centrify Agent for Mac,

Select this option	To do this
	<p>which you can use to enroll the computer.</p> <p>If you select this option, Centrify Join Assistant provides a download button to download the Centrify Agent for Mac.</p>

4. (Optional) Click the arrow to expand the Advanced Options and select any Advanced Options that you want to use to join the device.

Select this option	To do this
Overwrite existing joined computer	<p>Overwrite the information stored in Active Directory for an existing computer account. This option allows you to replace the information for a computer previously joined to the domain. If there is already a computer account with the same name stored in Active Directory, you must use this option if you want to replace the stored information. You should only use this option when you know it is safe to force information from the local computer to overwrite existing information.</p> <p>Checking this option is the same as running the <code>adjoin</code> command with the <code>--force</code> option.</p>
Container DN	<p>Specify the distinguished name (DN) of the container or Organizational Unit in which you want to place this computer account.</p> <p>By default, computer accounts are created in the domain's default Computers container.</p> <p>Click Browse to browse Active Directory and select the container to use, or click Container DN and enter the name of the container in distinguished name format; for example, if the domain suffix is <code>acme.com</code> and you want to place this computer in the <code>paris.regional.sales.acme.com</code> organizational unit, you would type:</p> <p><code>ou=paris, ou=regional, ou=sales</code></p> <p>Checking this option is the same as running the <code>adjoin</code> command with the <code>--container</code> option.</p>

Select this option	To do this
Preferred Domain Server	<p>Specify the name of the domain controller to which you prefer to connect. You can use this option to override the automatic selection of a domain controller based on the Active Directory site information.</p> <p>Checking this option is the same as running the <code>adjoin</code> command with the <code>--server</code> option.</p>
Computer Alias Name	<p>Specify an alias name you want to use for this computer in Active Directory. This option creates a Kerberos service principal name for the alias and the computer may be referred to by this alias.</p> <p>Checking this option is the same as running the <code>adjoin</code> command with the <code>--alias</code> option.</p>

5. Click **Join**.

Centrify Join Assistant informs you that you have successfully joined your Mac to your Active Directory domain at `<mydomain.com>`.

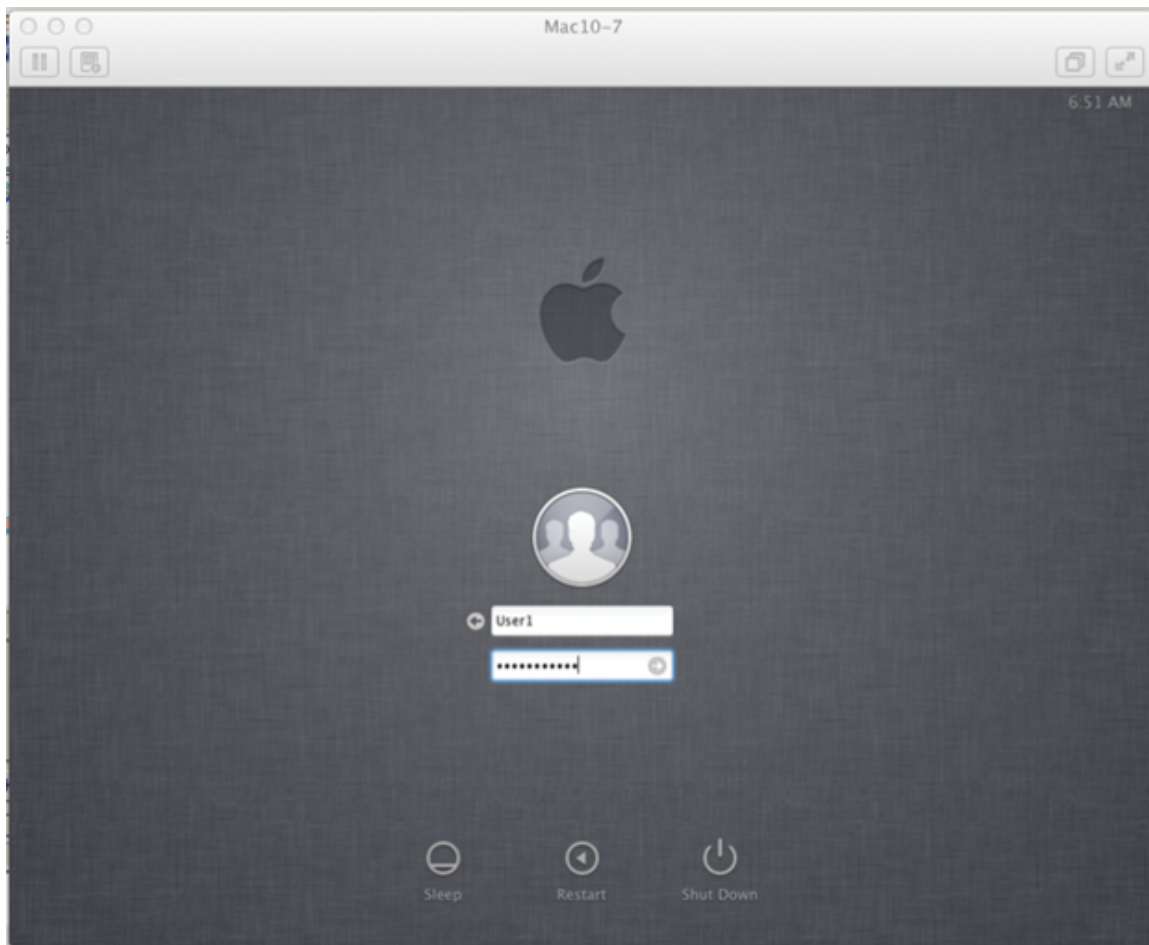

6. Click **Done** to close the installer.

Your Active Directory users can now log on to the joined Mac computer, as described in [Logging on to the Mac after joining a domain](#).

Logging on to the Mac after joining a domain

When using Auto Zone, all Active Directory users in the domain become valid users on a joined computer. To verify that Centrify is working properly, you can simply log into the Mac computer by using an Active Directory account.

On the Mac login screen, select **Other** and enter an AD user name and password:

Upgrading the Centrify agent

In most cases, you can update agents on Mac computers by simply installing the new agent either directly or remotely on top of an existing agent. As a best practice, you should perform in-place upgrades using a local Mac administrative (admin) account or any other user account that has local administrative rights and reboot the computer after completing the upgrade. In most cases, you should not perform the upgrade while you are logged on as an Active Directory user in a currently active session.

In rare cases, you might be advised to run `adf1ush` to clear the Active Directory cache before performing an in-place upgrade. For example, if you are updating agents from version 4.x, or earlier, to 5.1.x, run `adf1ush` first to ensure a smooth upgrade. It is highly unusual for an upgrade to require you to leave and rejoin a managed Mac computer to the domain.

Creating home directories

This chapter explains how to create different types of home directories for a Mac computer.

The following topics are covered:

- [Understanding home directories](#)
- [Configuring a local home directory](#)
- [Configuring a network home directory](#)
- [Configuring a portable home directory](#)

Understanding home directories

Whenever an Active Directory user logs in to a Mac computer, a home directory is created for the user. Mac provides three possible styles of home directory, which can be configured by an administrator to fit the type of user who will be using the computer, the type of computer, and the use to which the computer will be put. Auto Zone supports each of these styles:

- [Local home directory](#) — The user's home directory is created on the local computer in the Users folder with the user's login name (`/Users/username`).
- [Network shared directory](#) — The user's home directory is created on a network share.
- [Portable home directory](#) — The user's home directory is created on a network share and copied and synchronized to the local computer. This type of directory is also called a *mobile* home directory.

When you join a computer to a domain by connecting to Auto Zone, the home directory is created based on the following:

- Active Directory user settings; for example, an administrator can specify a network home directory in the Profile for an Active Directory user.
- Auto Zone default values; by default, Auto Zone is configured to support the creation of home directories in the Users folder on the local computer.
- Auto Zone parameters set in the Centrify configuration file, `/etc/centrifydc/centrifydc.conf` by an administrator or by a group policy. See the *Configuration and Tuning Reference Guide* for a description of all Auto Zone parameters.

The following sections explain in detail how to set up each type of user home directory.

Configuring a local home directory

In general, you do not need to explicitly configure local home directories for your Active Directory users because Auto Zone is configured to work for Active Directory users exactly as if they were local users. That is, by default, an Active Directory user who logs in to a Mac computer that is joined to a domain through Auto Zone is given a local home directory at `/Users/username`. For example, for a user, Glen Morris, whose login name is `gmmorris`, the local home directory is set to: `/Users/gmmorris`.

Although it generally isn't necessary to explicitly configure the agent for local home directories, in some situations you might want to do so. For example, if a Windows user has a local home directories defined in their Active Directory profile, that home directory will be assigned when the user attempts to log in and may prevent the user from logging in. The agent provides a configuration parameter (`auto.schema.use.adhomedir`) that you can set to ignore home directories in an Active Directory profile and always set the home directory to the default (`/Users/username`).

To explicitly configure a computer for local home directories:

1. On the Mac computer, edit the configuration file, `/etc/centrifydc/centrifydc.conf`.

2. Add the following two parameters:

```
auto.schema.use.adhomedir: false
auto.schema.homedir: /Users/%{user}
```

- Setting `auto.schema.use.adhomedir` to `false` configures the local computer to ignore any home directories that are set for users in Active Directory. This parameter is set to `true` by default.
- Setting `auto.schema.homedir: /Users/%{user}` configures the local computer to set the home directory to `/Users/username`, where *username* is the user logon name defined in the user's Active Directory account. Note that this parameter is set to this value by default on all Mac computers.

Note If you plan to configure network-home or portable-home directories for this computer, you must set `auto.schema.use.adhomedir` to `true`, the default value, otherwise, the agent will ignore the network home directories that you specify for users in Active Directory.

3. Save and close the file.

Configuring a network home directory

For each user whom you want to have a network home directory, you must specify the location in Active Directory.

Note In earlier releases you had to first create a network home directory for a user if you planned to also create a portable home (mobile home) directory for that user. With the current release, you can create portable home directories for users without first creating network home directories for those users.

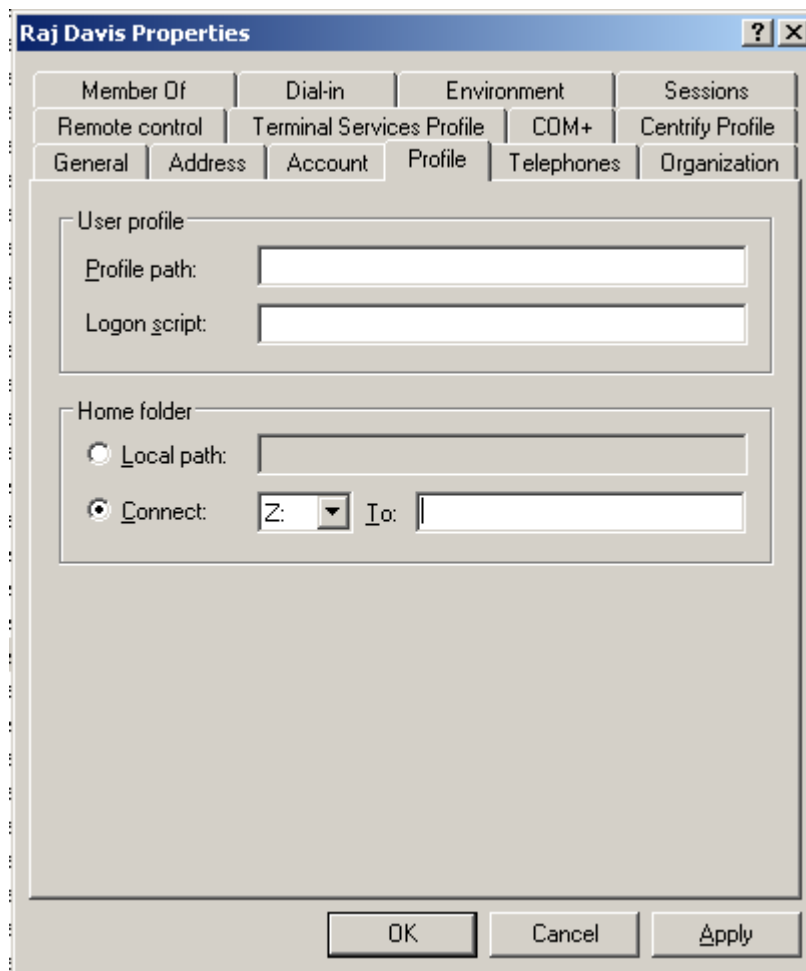

Configuring a network home directory for a user connected to Auto Zone:

1. Create a network share to host the home directory.

For example, on the dc-demo server (acme.com domain), create a network share called Macusers.

You must assign appropriate permissions to the network shared directory so the Active Directory account is able to write to the user's home directory. One way to do this is to assign read/write permissions to Authenticated Users on the network share. Each home directory that is created inherits permission from the network share so the account of the logged-in user is granted write permission its network home directory. See [Setting shared directory permissions](#) for more details about properly setting and fine-tuning network share permissions.

2. On a domain controller in the forest to which the Mac OS computer is joined, open Active Directory Users and Computers.
3. Select **Users**, select the user, then right-click the user and click **Properties**.
4. Click the **Profile** tab, then under **Home folder** select **Connect**.

5. In **Connect...To** type the location of the share you created in Step 1 by using the following format:

//Server/share/path

For example:

//dc-demo.acme.com/MacUsers/rdavis

6. Click **OK** to save the user profile.
7. (Optionally) By default, the agent is configured to use the Active Directory home folder if one is specified in a user's profile. However, to be explicit, you can edit the configuration file and add the following parameter:
`auto.schema.use.adhomedir: true`
 Save and close the file.
8. Specify the type of share to mount for the network home directory on

the Mac computer, SMB, or AFP.

By default, the Mac computer will attempt to mount an SMB share for the network home. If you specified an AFP share, you must set the following parameter in the configuration file:

```
auto.schema.remote.file.service:AFP
```

Or enable the **Computer Configuration > User Configuration > Policies > Centrify Settings > DirectControl Settings > Adclient Settings > Auto Zone remote file service** group policy to specify SMB (the default) or AFP for all Mac computers.

9. Optionally, if you want the network home directory to be mounted automatically on the user's computer, enable the following group policy: **User Configuration > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Automount Settings > Automount user's Windows home**.

When the specified user next logs onto the Mac computer, the home directory will be created on the specified share. On the Mac computer, you should see the server and share under **SHARED** in the Finder.

Configuring a portable home directory

You can create a portable home directory for a user and synchronize that directory with the share defined in the user's Centrify Profile. You can synchronize to /SMB/, /AFP/, or /Network/Servers (NFS) shares.

Advantages of a portable home directory are as follows:

- If a user does not have a portable home directory and the computer becomes disconnected from the domain controller (and therefore disconnected from Active Directory), the user can log in with Active Directory credentials only if the user's information exists in the Centrify cache. If there is any issue with the Centrify cache (for example, if the `adflush --force` command was issued to flush the cache immediately before the computer was disconnected from the domain), Active Directory users cannot log in unless they have portable home directories.
- Active Directory users without portable home directories are required to log in at least once in connected mode to populate their account

information in the Centrify cache. If the computer is not connected to the domain controller, the Centrify cache is not updated with the initial set of Active Directory user data, and Active Directory users cannot log in.

You use group policies to configure synchronization. These group policies perform the same function as the Mobility preferences that you can manage through Workgroup Manager.

The following sections describe the process of specifying the options for creating mobile accounts, and for specifying the options for synchronizing mobile accounts with the network home directory.

Before you begin you should have the following in place:

- A Group Policy Object that applies to a domain or OU that includes Mac users.
- A good understanding of the synchronization rules that you want to apply. The procedures in the following sections explain the group policies and options that you can enable, but you should consult the Mac OS X Server documentation for strategies about which options to apply.

Creating mobile user accounts

To automatically create mobile user accounts:

1. Perform this step only if you will require mobile account users to first have network home directories (in Step 10 on page 33 you will specify whether this is a requirement). If you will not require mobile account users to first have network home directories, go to Step 2 and continue from there.
 - a. In Active Directory Users and Computers, create or select the Active Directory user account to use.
 - b. Click the **Profile** tab to define a network home for the new user. For example, in the Profile tab select **Connect**, a drive letter, and a home path, such as `\\dc-demo.acme.com\MacUsers\rdavis`.
 - `dc-demo.acme.com` is the Windows network server, including the domain name

- MacUsers is a shared folder on the server
 - rdavis is the user's home directory on the server
- c. Click **OK** to save the user information and create the network home directory. This directory must exist for folder synchronization.

If you will require mobile account users to first have network home directories (as configured in Step 10 on page 33), only users with their home directory set to a /SMB/ or /AFP/ network share in their Centrify Profile can have a mobile account created and synchronized. Users with a local home directory are not prompted to create a mobile account and will not have one created for them unless you create it manually.

Note For users with their home directory set to /Network/Servers, the shared directory must already exist on the NFS server before users login because Access Manager cannot create the directory automatically at login. If the shared directory exists, Access Manager will synchronize it at login. Therefore, for users whose mobile-home directory is on an NFS share, be certain to create all mobile-user home directories on the network share before users log into the Mac computer.

2. (For NFS shares only) Configure the NFS share as an automount point. Skip this step for an SMB or AFP share.

Go to [Configuring an automount point for an NFS share](#). After configuring the automount point, return to the current procedure and go to the next step.

3. Set appropriate permissions for the shared directory; see [Setting shared directory permissions](#) for details about how to do this.
4. Open the Group Policy Management Editor to edit the group policy object that is applied to a domain or organizational unit that includes Mac users:
 - a. Select **Start > Group Policy Management**.
 - b. Navigate to **Forest forest_name > Domains > domain_name > Group Policy Objects**.
 - c. Right-click **Default Domain Policy** and select **Edit**.
5. In Group Policy Management Editor, navigate to **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings**.

6. Open the **Use version specific settings** group policy.

This group policy allows you to use mobility settings that are specific to the version of Mac that you are using. If you enable this group policy, you can use version-specific settings that will exactly match the Mac version that you are running. As an alternative, you can use legacy settings that are not specific to the version of Mac that you are using. To do so, skip this step, navigate to **Legacy Settings**, and go to Step 9.

7. In the **Use version specific settings** group policy, click **Enable**, then **OK**.
8. In the **Mobility Settings** folder, double-click the folder for your version of Mac OS X. If your environment contains computers running multiple versions, you need to configure the policies for each version.

These group policies correspond to the Mobility preferences you can manage using the Mac OS X Workgroup Manager.

9. If you are using version-specific group policies, double-click the **Configure mobile account creation** group policy. If you are using legacy group policies, double-click the **Enable/disable synchronization** group policy.
10. Click **Enabled** and select one or more of the following group policy options:
 - **Create mobile account when user logs in to network account** to automatically create a mobile account when the Active Directory user logs in.
 - **Create mobile account even if user does not have a network home directory** to create mobile accounts automatically for users the next time they log in to the Mac. This applies to all users, including users who do not have a network home directory. To use this option, you must also select the **Create mobile account when user logs in to network account** option.
 - **Require confirmation before creating a mobile account** if you want the user to be prompted to confirm the creation of the mobile account.
 - **Create home using network home and default sync settings** to initially sync local and network home directories so that the network home directory replaces the local home directory. When

the local home directory is created, it contains the contents of the network home directory instead of the default subdirectories (such as **Downloads**, **Documents**, **Music**, and so on). You cannot use this option if you select the **Create home using local home template** option.

- **Create home using local home template** to create the local home directory using the local home default template. When the local home directory is created, it contains the default set of subdirectories (such as **Downloads**, **Documents**, **Music**, and so on). You cannot use this option if you select the **Create home using network home and default sync settings** option.

11. Click **Apply**.

If you are using version-specific group policies, click **Next Setting** to go to the **Configure mobile account options** policy. Go to Step 12 and continue from there.

If you are using legacy group policies, click **OK** to save your changes.

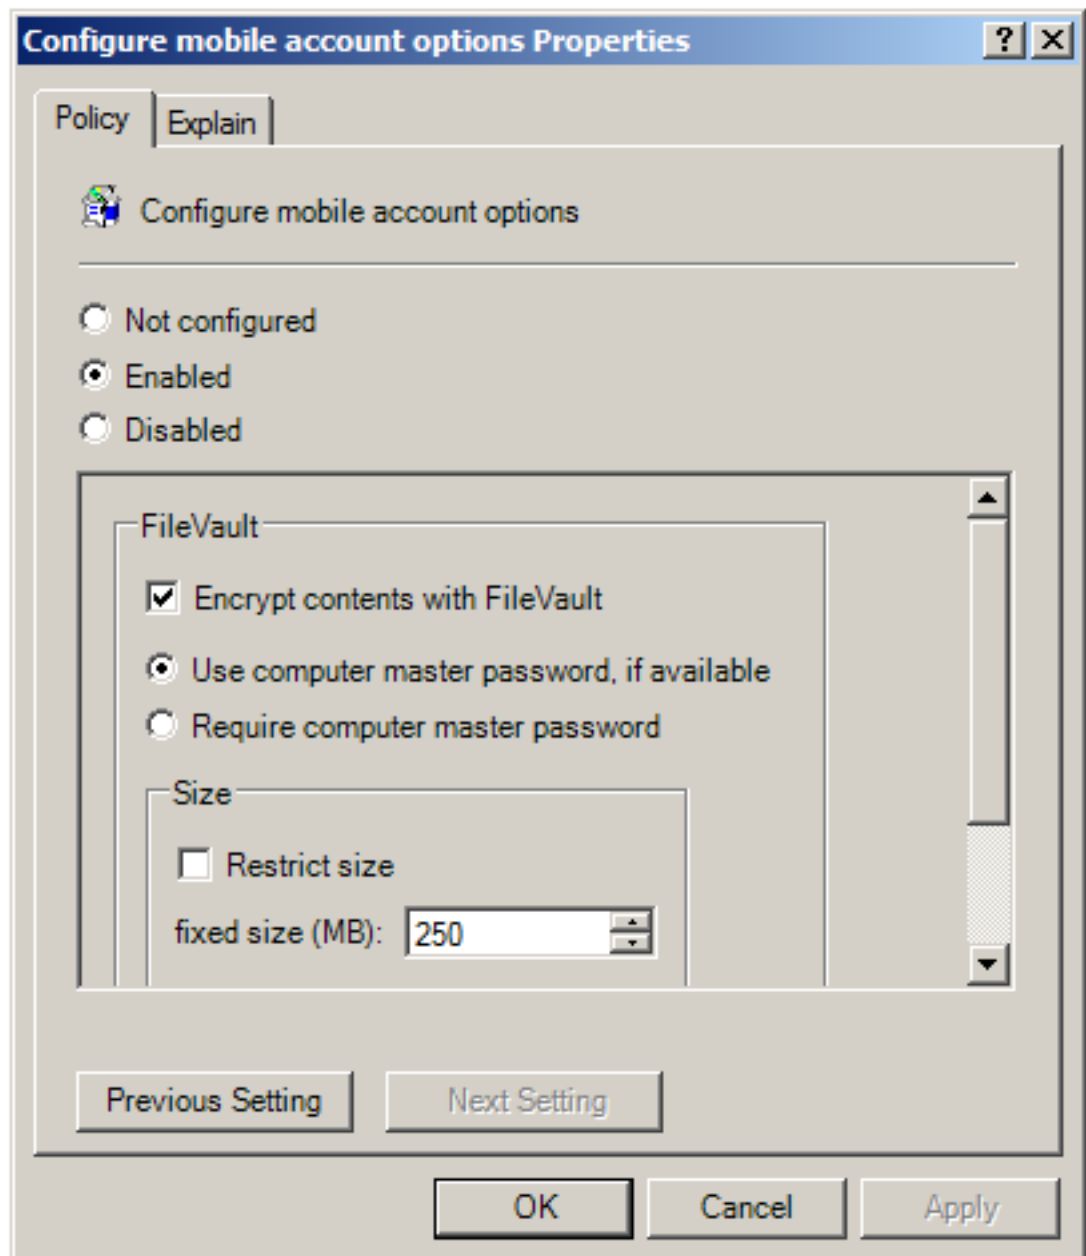

12. In the **Configure mobile account options** policy, check the following:

- **Encrypt contents with FileVault** to encrypt the mobile home directory using the Mac OS X FileVault system.

FileVault protection can only be applied when a new mobile user is created at login. FileVault protection cannot encrypt an existing mobile-user home directory.

Select one of the computer master password options. The computer master password is a safety feature that allows you to unlock the FileVault disk image if the Active Directory user forgets their password.

- **Use computer master password, if available** — With this option checked, the mobile account will be created and FileVault protection applied whether or not a computer master password is available.
- **Require computer master password** — With this option checked, the mobile user account will only be created if a master password is available for the computer. You can create a master password by clicking: **System Preferences > Security > FileVault > Set Master Password**.

Do not select **Restrict size**, unless you want to limit the size of the local home folder.

Click **OK** to apply this group policy and close the properties page.

If you want to test the creation of the mobile user account before configuring synchronization rules, you can log on to a Mac computer using the Active Directory user you created or selected in Step 1. When you are prompted to create a mobile account, click **Yes**. A local copy of the remote network home directory will be created according to the rules you have defined with the group policies in the **Synchronization Rules: Background Sync** category. After this initial synchronization, when you successfully log on as a valid user,

Centrify Infrastructure Services begins synchronizing the files and folders you have defined with the group policies in the **Synchronization Rules: Login & Logout Sync** category between the local home directory and the network share home directory.

For information about defining synchronization rules, items to be synchronized, and the items to skip during background updates, see [Configuring background synchronization rules and interval](#). For information about defining synchronization rules, items to be synchronized, and the items to skip when users log in and log out, see [Configuring login and logout synchronization rules](#).

Configuring login and logout synchronization rules

If you enable the creation of mobile accounts, you should use the group policies in the **Synchronization Rules: Login & Logout Sync** category to define the folders that should be synchronized when users with mobile accounts login and logout. You can also use the **Skip these items** group policies to define criteria for folders or items that should not be synchronized when mobile users login and logout.

To control which items are synchronized when users log in and log out:

1. Open **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Synchronization Rules: Login & Logout Sync**.
2. Select the **Enable/disable login & logout synchronization rules** group policy, right-click, then click **Properties**.
3. Click **Enabled** to activate synchronization rules each time users log in and log out.
 - Select **Merge with user's settings** if you want items selected by the user to be included to the synchronization list. If you select this option, be aware that any items users add locally for synchronization override any settings you make with the Skip these items group policies. Therefore, if you want to enforce restrictions on what to exclude for synchronization, you should uncheck this option.
 - Select **Skip preset items** if you want to skip a preset list of items in

the ~/Library directory and items that start with IMAP- and Mac- in their names.

4. Click **Next setting** to select the **Items that will be synchronized at login and logout** group policy to specify items to be synchronized.
5. Click **Enabled**, then click **Show**.
6. Click **Add**, then type the tilde character (~) to synchronize all items you do not specifically exclude, then click **OK**.
7. Click **OK** to close the Show Contents dialog box, then click **OK** to apply the group policy settings.
8. Open **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Synchronization Rules: Login & Logout Sync > Skip these items**.

Use the **Skip Items** group policies to define the specific items you want to exclude from synchronization. For example, if you want to prevent all of the files and folders contained in the ~/Music, ~/Movies, and ~/Pictures directories from being synchronized to the server, you would do the following:

- Enable the **Enable/disable login & logout synchronization** group policy and deselect **Merge with user's settings** and **Skip preset items**.
- Enable the **Items that will be synchronized at login and logout** group policy and specify ~ as the path.
- Enable the **Skip items whose partial path matches** group policy, then click **Add** and specify the ~/Music, ~/Movies, and ~/Pictures directories. For example:

- Click **OK** when you are finished adding the items you want to skip.
- Click **OK** to close the Show Contents dialog box. You can click **Previous Setting** or **Next Setting** to add other items you want to exclude using another criteria.

Note Using the **Skip items whose full path is** group policy to specify a directory, such as ~/Music, only prevents items in the specified directory from being synchronized. It does not apply to items in subdirectories of the specified directory. Therefore, you should

Note use the **Skip items whose partial path matches** group policy to exclude items contained within subdirectories because this policy matches any directory or subdirectory that includes the specified string in its path — not just directories whose path matches exactly. For example, to prevent items in ~/Music/Rap and ~/Music/Classical from being synchronized, use **Skip items whose partial path matches:~/Music**.

9. Click **OK** to apply the group policy settings.

Configuring background synchronization rules and interval

If you enable the creation of mobile accounts, you should also use the group policies in the **Synchronization Rules: Background Sync** category to define the folders that should be synchronized in the background. You can also use the **Skip these items** group policies to define criteria for folders or items that should not be synchronized.

To control which items are synchronized in the background:

1. Open **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Synchronization Settings > Synchronization Rules: Background Sync**.
2. Select the **Enable/disable background synchronization rules** group policy, right-click, then click **Properties**.
3. Click **Enabled** to activate background synchronization rules. In most cases you should use the following settings:
 - Deselect **Merge with user's settings** if you want to prevent users from adding items to the synchronization list and overriding items you do not want to be synchronized.
 - Select **Synchronize user's home directory** to have the home directory automatically synchronized at a regular interval.
 - Deselect **Skip preset items** if you want to explicitly define the items or directories to skip.
4. Click **Next Setting** to select the **Items that will be synchronized in the background** group policy.
5. Click **Enabled**, then click **Show**.

6. Click **Add**, then type the tilde character (~) to synchronize all items you do not specifically exclude, then click **OK**.
7. Click **OK** to close the Show Contents dialog box, then click **OK** to apply the group policy settings for the files and folders to be synchronized in the background.
8. Open **User Configuration Policies > Centrify Settings > Mac OS X Settings > Mobility Synchronization Settings > Synchronization Rules: Background Sync > Skip these items**.

Use the **Skip Items** group policies to define the specific items you want to exclude from synchronization. For example, if you want to prevent all of the files and folders contained in the ~/Music, ~/Movies, and ~/Pictures directories from being synchronized to the server, you would enable the **Skip items whose partial path matches** group policy, click **Show**, then **Add**, and add the ~/Music, ~/Movies, and ~/Pictures directories, one at a time, to the list of items you want to skip, then click **OK** to close the Show Contents dialog box.

You can click **Previous Setting** or **Next Setting** to add other items you want to exclude using another criteria, for example, items that start with a specific string.

9. Click **OK** to apply the group policy settings for the files and folders to skip during synchronization.
10. Open **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Synchronization Settings > Synchronization Rules: Options**.
11. Select the **Manually/automatically synchronize background folders** group policy, right-click, then click **Properties**.
12. Click **Enabled** to activate background synchronization options, then select whether to synchronize background folders **automatically** or **manually**. If you select **manually**, users should periodically select **Sync Now** from the Accounts page of System Preferences. If you select **automatically** to allow items to be synchronized in the background automatically, you should also set the interval for synchronizing background folders.

In most cases, you should use the following settings:

- Select **automatically** to have items synchronized automatically in the background at a regular interval.
 - Set the **interval in minutes** for periodically synchronizing folders in the background. Folders can be synchronized from every 5 to every 60 minutes, but synchronization can only take place if there is a connection to the network. In selecting an interval, you should consider the size and number of files and folders to be synchronized and the level of network traffic.
13. Click **OK** to apply the group policy settings for synchronizing files and folders in the background.

Configuring an automount point for an NFS share

If you are configuring mobile-home-directory synchronization ([Setting shared directory permissions](#)) for an NFS share, you must configure the NFS share as an automount point (see [Creating mobile user accounts](#)). This section explains how to do this.

To configure an automount point:

1. With a text editor, create or edit `/etc/fstab` and add a line similar to one of the following, depending on how you are configuring the NFS mount:

```
nfs_server:/nfs_share dummy_mountpoint nfs net 0 0
```

For example:

```
rhes.acme.com:/nfsshare/ dmpoint nfs net 0 0
```

or

```
nfs_server:/nfs_share dummy_mountpoint url  
net,automounted,url==nfs://nfs_server:/nfs_share 0 0
```

For example:

```
rhes.acme.com:/nfsshare/ dmpoint url  
net,automounted,url==nfs://192.168.1.70:/nfs_share 0 0
```

• • • • •

Note You can specify any directory for the mount point as it will be under /Network/Servers in any case.

2. Run the automount command to reload automount settings:

```
automount -c
```

If you are configuring automount for NFS as part of setting up a mobile user account, return to [Creating mobile user accounts](#) to complete the procedure.

Working with Macs

This chapter describes the unique characteristics or known limitations that are specific to using Centrify Management Services on a Mac computer.

The following topics are covered:

- Specifying the Macintosh user's home directory location
- Setting shared directory permissions
- Enabling users to manage their print queues
- Setting up authenticated printing
- Setting up local and remote administrative privileges
- Querying user information for Active Directory users
- Migrating from Open Directory to Centrify Active Directory
- Converting a local user to a Centrify Active Directory user
- Migrating a user from Apple's Active Directory plugin to Centrify Active Directory
- Using Apple's scheme to generate UIDs and GIDs for Mac users
- Mapping local user accounts to Active Directory
- Configuring auto-enrollment
- Configuring 802.1X wireless authentication
- Configuring single sign-on for SSH and Screen Sharing
- Configuring FileVault 2
- Deploy configuration profiles to multiple computers

Specifying the Macintosh user's home directory location

If you configure NFS, SMB, or AFP network file sharing for your Mac OS X computers, you can automatically mount and log on to file shares using Active Directory credentials.

To enable Mac OS X users to log on to file shares when the network is configured with NFS, SMB, or AFP network sharing:

1. Open Active Directory Users and Computers or the Access Manager console.
2. Select the user account for which you want to enable automounting, right-click, then click **Properties**.
3. Click the **Centrify Profile** tab and set the **Home directory** path to use one of the following formats:
 - `/Users/user_login_name` to set the user's home directory to the default home directory location for all user home directories on Mac OS X computers.
 - `/SMB/server_name/share[/path]` to automount a file share on the SMB *server_name* you specify. Be certain to use the fully-qualified domain name for *server_name*, or the IP address. The short name does not work. For example:
`/SMB/myHost.acme.com/Users/isuzuki`
 - `/SMB/unix_username/server_name/share[/path]` to automount a file share when you are using Fast User Switching on the SMB *server_name* you specify. Be certain to use the fully-qualified domain name for *server_name*, or the IP address. The short name does not work. For example:
`/SMB/isuzuki/myHost.acme.com/Users/isuzuki`
 - `/AFP/server_name/share[/path]` to automount a file share on the Apple *server_name* you specify.
 - `/AFP/unix_username/server_name/share[/path]` to automount a file share when you are using Fast User Switching on the Apple *server_name* you specify.

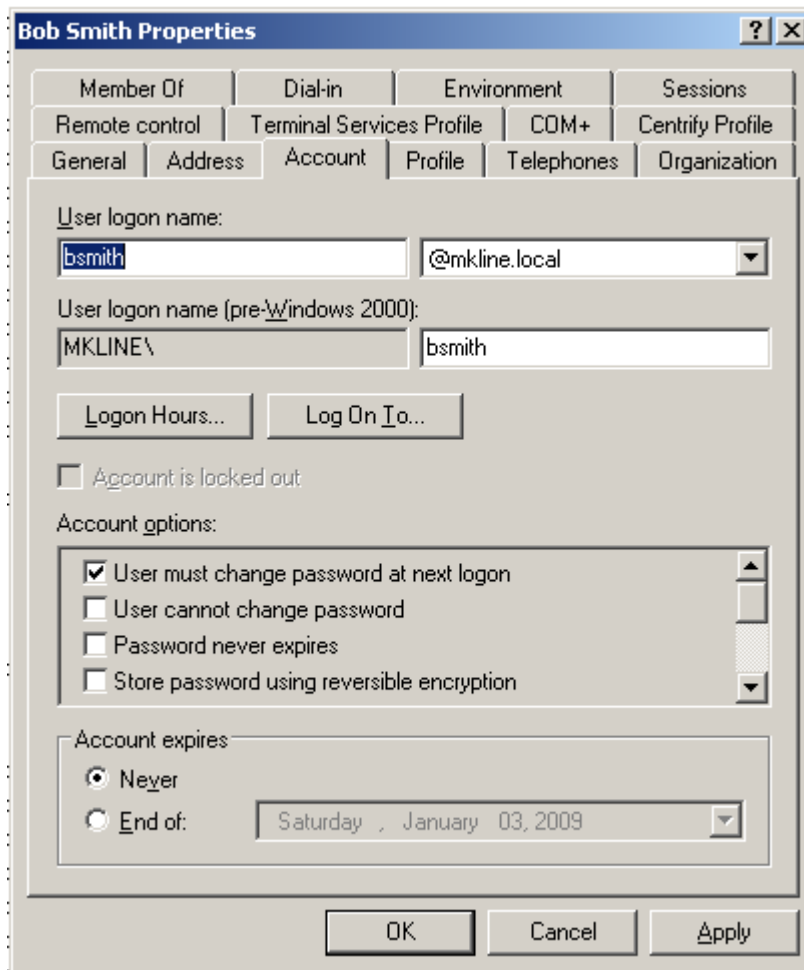

In specifying the remote SMB or AFP file share, you must use the uppercase letters SMB or AFP at the beginning of the path. If you use lowercase letters (smb or afp), automounting fails.

Note If you plan to use Fast User Switching to switch between Active Directory users on the same computer, you should use the `/SMB/unix_username/server_name/share[/path]` or `/AFP/unix_username/server_name/share[/path]` format to specify the user's home directory to prevent conflicts between users logging on using the same share. If you want to automount a share on an Apple file server using the Apple File Protocol (AFP), however, you must use Centrify 3.0.1 or later.

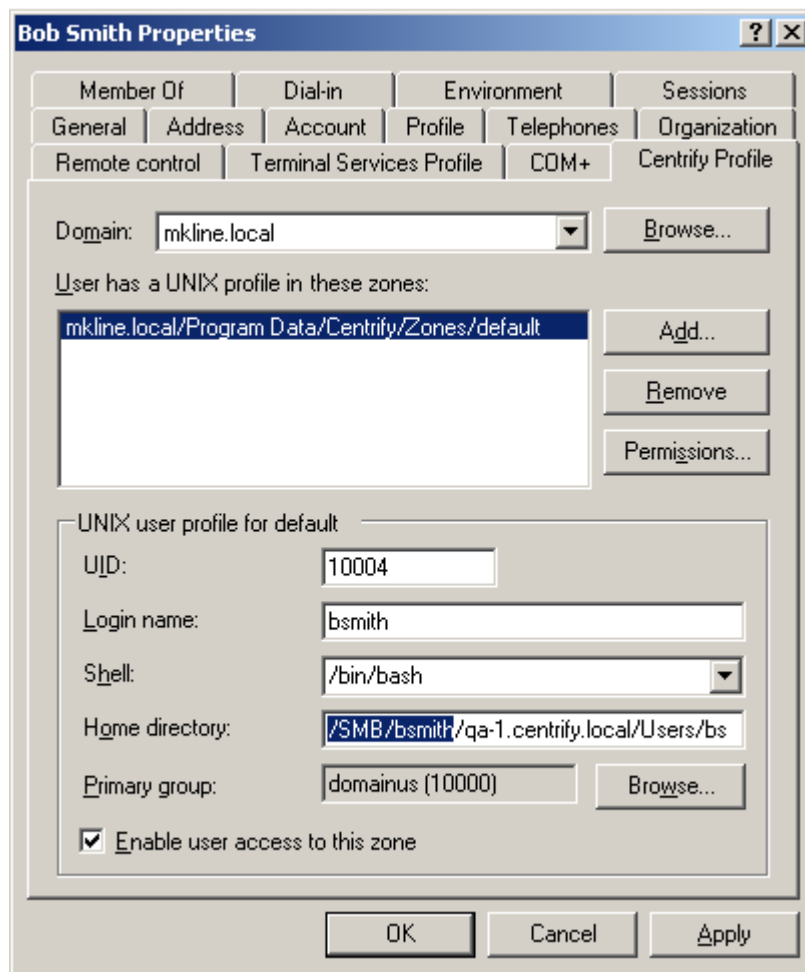

4. In Step 3, if you specified a network directory, make certain that the Active Directory user logon name (pre-Windows 2000), also known as the `samAccountName`, matches the Mac login name (UNIX name). Otherwise, the login is not guaranteed to work on all Mac systems.

The name must be 8 characters or less because the UNIX name is automatically truncated to 8 characters and won't match if the Active Directory name is longer.

The Active Directory name is defined in the **Accounts** tab. For example, if you open the **Properties** page for a user and select **Account**:

Select the **Centrify Profile** tab to see the UNIX name:

5. For the shared directory you specified in Step 3 (for example, users), set 'full' permissions for authenticated users. See the next section, [Setting shared directory permissions](#), for details on how to do this.
6. Verify that the computer on which the shared directory resides is configured on the DNS server with forward and reverse lookup zones by running the following commands in a terminal window:

```
nslookup computerName.domainName
```

for example:

```
nslookup QA1.acme.com
```

```
Server: acme.com
```

```
Address: 192.168.1.139
```

```
Name: QA1.acme.com
```

```
Address: 192.168.1.139
```

• • • • •

```
nslookup ipAddress
```

for example:

```
nslookup 192.168.1.139
```

```
Server: acme.com
```

```
Address: 192.168.1.139
```

```
Name: QA1.acme.com
```

```
Address: 192.168.1.139
```

If you get an error message such as

```
Can't find server name for address 192.168.1.139
```

it means a reverse lookup zone is not configured for the specified server. To configure DNS forward and reverse lookup zones, see the [Microsoft Knowledge Base Article 323445](#).

Populating the home directory on a network share

If you configure users to automount a network share when they log on, you must determine whether a home directory already exists on the network share for those users. If the individual user's home directory does not exist on the network share, Access Manager creates the home directory automatically the first time the user logs on.

Note For NFS shares, Access Manager cannot create the home directory on the network share, so you must create the directory before users log in for the first time.

For example, assume you have defined the home directory in a user's Centrify Profile as: `/SMB/demo-dc.acme.com/home/thomas`, which indicates that there is an SMB share on the server `demo-dc` and a shared folder named `home` on which the user `thomas` has permission to list folders and create folders.

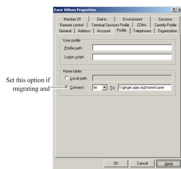

Note For the server name, be certain to use the fully-qualified domain name, as in the example (`demo-dc.acme.com`), not the short name (`demo-dc`).

When the zone user `thomas` logs on for the first time, Access Manager creates the new home directory `thomas` and populates it with the standard Mac OS X files and folders.

If the home directory specified in the Centrify Profile for a zone user exists prior to the user's first logon, Access Manager assumes that the directory is valid and contains the appropriate files and does not populate it with additional Mac-specific folders.

Defining a home directory in the Active Directory profile

When you are configuring a network home directory for remote Mac users, the home directory is created automatically when users first log on and should not exist prior to that initial log on unless you want to prevent Access Manager from creating the home directory. Therefore, you should not define a home directory connection point in the Profile properties for new Active Directory users or new mobile user accounts. Instead, you should allow Access Manager to create and populate the remote home directory. If you need to synchronize a network home directory from a local home directory as part of your migration process, however, the network home directory must exist prior to migration. If you are synchronizing from a local home directory to a remote share, you can create the remote home directory manually or click the **Profile** tab, and set the connection path. For example:

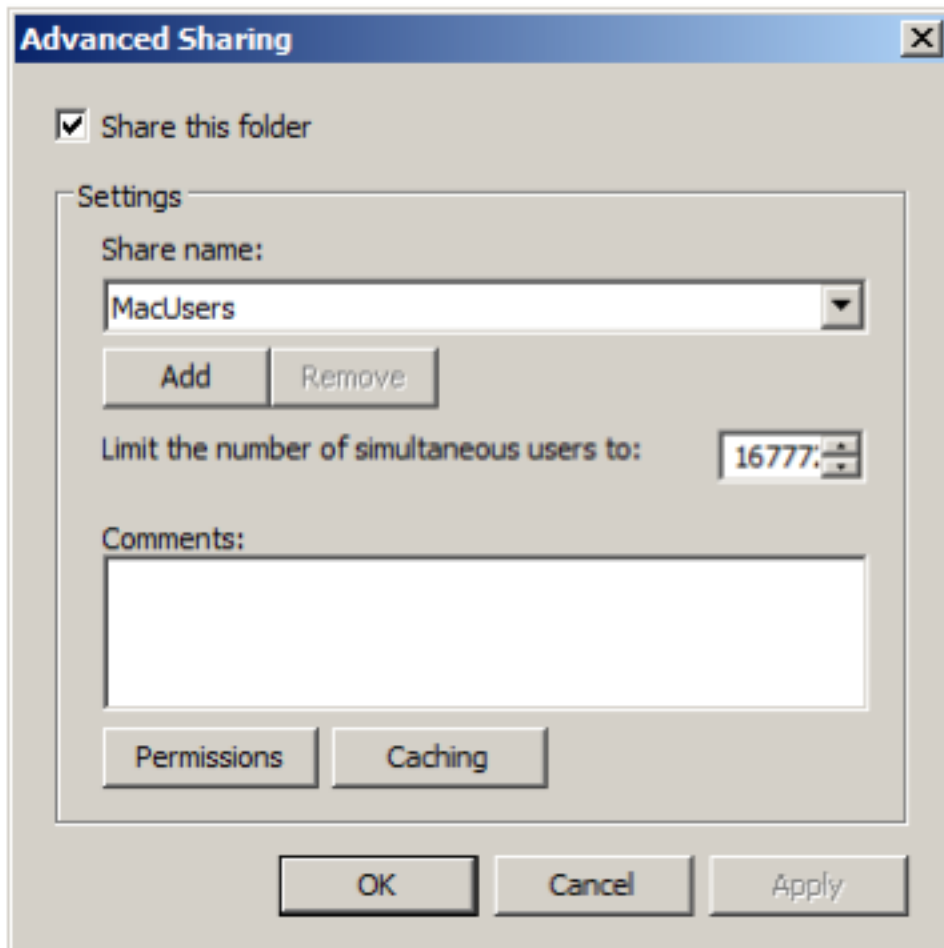

Setting shared directory permissions

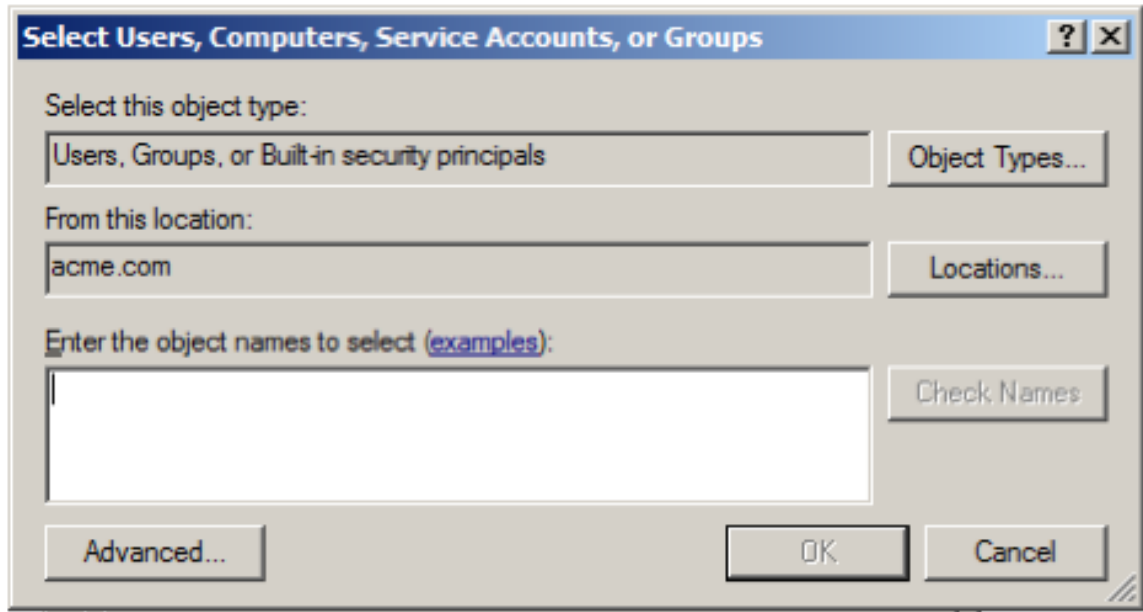

All users who are set up with a network home or portable home directory must have proper permissions to the shared directory in which the home directories are created. Initially, you can provide access to the shared directory through the Windows built-in security group, Authenticated Users. Later on, you can fine tune permissions for this group based on your company's file sharing needs. For example, if an administrator pre-creates home directories for each user before they log in, users only need Read access to the shared directory in order to access their home directories.

To set permissions for the shared directory for network home and portable home directories:

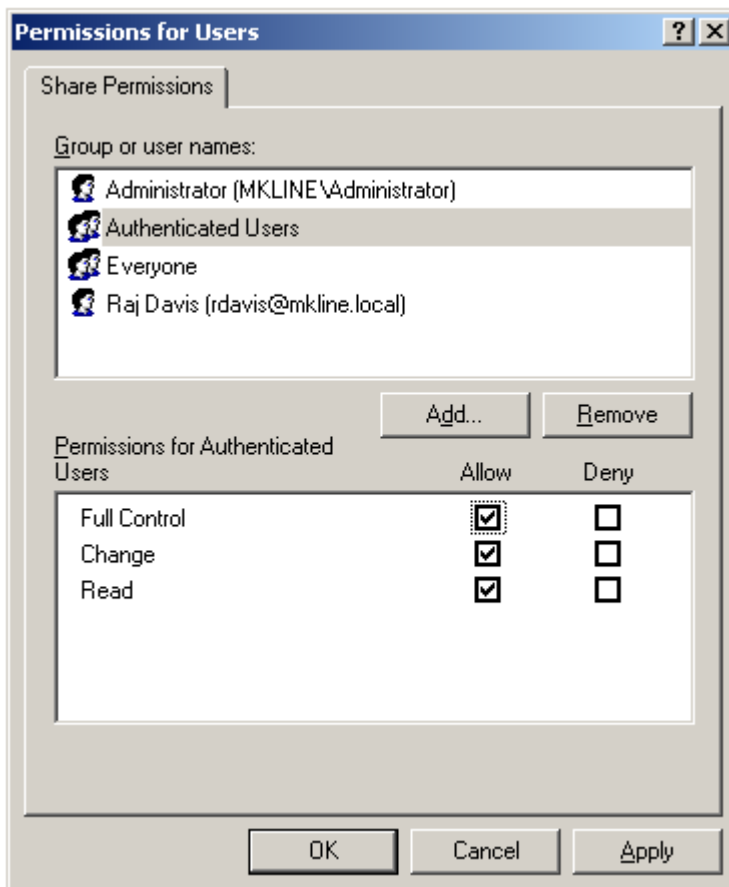

1. On the network share computer, select the directory to share (for example, MacUsers). Right-click, click **Properties** and click the **Sharing** tab; then click **Advanced Sharing**; for example:

2. Make certain that **Share this folder** is selected. Click **Permissions**, then click **Add**:

3. Type **auth** and click **OK** to return the Authenticated Users group. Select **Authenticated Users**, then click **Allow** for **Full Control**. Click **OK** to set permissions for authenticated users, then **OK** again to close the properties page.

4. Verify that Authenticated Users have proper permissions on the **Security** tab as well as on Share Permissions.

Ordinarily, this is automatic because the Active Directory Users group, which includes authenticated users, inherits Full Control to the shared folder, but if permissions were altered on the Security tab, and are not sufficient, users may not be able to log in.

Click the **Security** tab and select **Authenticated Users** (or click **Add** to add it if it is not already in the Group or user names box).

5. Select **Full control** and click **OK** to save and close the Properties page.

Assigning permissions to Authenticated Users on the network home share directory means that each home folder will inherit the proper permissions to allow logged-in users to access their home directories. It also means that every user will have access to every other user's home directory. To change this, you can set permissions on the individual home directories. See [Limiting users access to other users' home folders](#) for information about fine tuning permissions for individual users.

Limiting users access to other users' home folders

The previous section showed how to assign permissions to a network-home shared folder, which are consequently inherited by the home folders created in the shared folder. Because permissions are inherited, each user has equal access to every other user's home folder. This section shows how to fine-tune permissions to limit user's access to their own home folder.

Limiting users access to their own home directory

1. Select the network share you assigned permissions to in the previous section.
2. Select one of the user home directories in the network share.
3. Click the **Security** tab. Then click **Advanced** and **Change Permissions**. Deselect **Include inheritable permissions from the object's parent** and click **Remove** when prompted.
4. Click **Add** and type users and click **Return**. Select the following permissions for Users:

- Traverse folder / execute file
 - Read Attributes
 - Read Extended Attributes
 - Create files / Write Data
 - Create Folder / Append Data
5. Click **OK**, and **OK** again until you have saved all the open dialogs and closed the Properties page.

Enabling users to manage their print queues

On Mac computers, Centrify Active Directory users are unable to manage their own print jobs. For example, if they attempt to pause, stop, or resume one of their own print jobs, they are prompted to supply the name and password of a user in the “Print Operator” group, otherwise, they cannot continue.

Centrify supplies the group policy, Map zone groups to local group, that you can use to enable all Mac users who are authenticated through Active Directory to manage their printers.

This policy gives members of a specified zone group (an AD group, or AD group that has been added to a Centrify zone) the privileges that belong to members of a local group on the local group. For example, as explained in the following procedure, mapping an AD group to the local `_lpoperator` and `_lpadmin` groups, provides members of the AD group with the privileges to manage print jobs on the local Mac computer when they log in.

To map a zone group to local `_lpoperator` and `_lpadmin` groups:

For purposes of illustration, this procedure instructs you to create a specific group (MacPrint) and add the users who you want to manage printers on Mac computers to this group. You could also map an existing AD group to the local `_lpoperator` and `_lpadmin` groups, or create a new group with a different name.

1. On a Windows computer, open Active Directory Users and Computers, select **Users** and right-click and select **New > Group**.

2. Enter a name for the group, such as MacPrint and select **Global** and **Security**.
3. Double-click the group, select the **Members** tab, then click **Add** and browse for and add the AD users who you want to have printing privileges on the Mac computer.
4. Open the Access Manager Console, expand the zone hierarchy and expand the zone containing Mac computers. Expand **UNIX Data**, select **Groups**, then right-click and select **Create UNIX Group**.
5. Browse for and select the AD group you created (MacPrint) and click **OK** to add it to the zone.
6. Open the Group Policy Management Editor and select the GPO that you use for Mac OS X computers. Click **Computer Configuration > Policies > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Accounts**, then double-click **Map zone groups to local group**.
7. Click the **Policy** tab and click **Enabled**. Click **Add** and do the following:
 - a. In **Local Group**, type `_lpoperator` to add the printer operators group.
 - b. In **Zone Group**: click **Browse** then search for and select the AD zone group you created (MacPrint), then click **OK** to map MacPrint to the printer operators group.
 - c. Click Add again and in Local Group type `_lpadmin` to add the printer admin group.
 - d. In **Zone Group**: click **Browse** then search for and select MacPrint again to map MacPrint to the printer admin group.
8. Click **OK** to save the policy.

The first time users attempt to manage their printer, for example by pausing the printer, they will be prompted for credentials for a user in the “Printer Operator” group. They can simply enter their own name and password. Subsequently, they can manage the printer without supplying credentials.

Setting up authenticated printing

In a Windows Active Directory environment that requires authentication for printing services, Mac users who are already authenticated must provide

credentials again when using a Windows network printer. To provide single-sign on when using printers, the Centrify agent for Mac computers includes an authenticated printer plug-in that enables users to send print jobs to printers on the Windows network without requiring them to enter credentials again. This plug-in uses the user identifier (UID) of the user printing a job to find the user account to authenticate, then validates the user's Kerberos credentials through Active Directory. If the user's credentials are not available, the print job will fail.

Understanding printing on Mac OS X

Mac uses the Common UNIX Printing System (**CUPS**) to manage printing services. Although you can access the CUPS facility directly to manage printers, in general you do not need to do so. Printers are managed through the Print and Scan system preference, which uses the CUPS facility. For example, when you add a printer through Print and Scan, the CUPS facility does the following:

- Creates a Postscript Printer Description (PPD) file that defines the printer. The file is given the name of the printer and resides in the `/etc/cups/ppd` directory; for example, `/etc/cups/ppd/laserjet2.ppd`.
- Modifies the CUPS configuration file, `/etc/cups/printers.conf`, with information about the new printer.

One method to set up authenticated printing for all Mac computers in your environment is to configure an authenticated printer on one (template) computer, then export the files that CUPS creates to define this printer (`printerName.ppd` and `printers.conf`) to each of your Mac computers. You can use group policy to export these files to all your Mac computers.

You can also configure printing directly with CUPS commands.

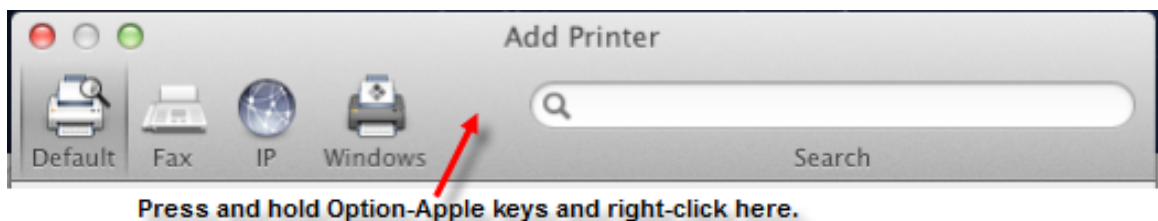

To set up authenticated printing for multiple printers you can do the following:

To set up authenticated printing using the Centrify plug-in:

To begin this procedure, identify the printer to configure, including the server that hosts it; for example, `HPLaserJet2.@dc01`.

1. On the Mac computer that you will use to define an authenticated printer template, open **System Preferences > Print & Scan** (**Print & Fax** on older systems), then click the plus sign (+) and select **Add Other Printer or Scanner**.
2. Double-click the **Advanced** icon in the toolbar.

Note If the Advanced option is not showing, press and hold the **Option** and **Apple** keys and right-click in the open area in the toolbar next to the Windows icon and select **Customize Toolbar**. Drag the Advanced icon to the toolbar and click **Done**. Then double-click it.

3. Scroll in the **Type** drop-down list and select **Windows Printer via Centrify** from the list.

Note that after you make this selection, the URI scheme in the Device URI window changes to `cdcsmb://`, which specifies the Centrify plugin.

4. Type the complete URI specification for the printer in the form:

`scheme://servername/sharename`

for example:

`cdcsmb://printserver.acme.com/hplaserjet2`

Note A URI specification does not accept spaces. If the printer share name contains spaces, you must replace them with %20 (ASCII code for space); for example, to specify the **HP Color LaserJet 4** printer:

`cdcsmb://printserver.acme.com/HP%20Color%20LaserJet%204`

5. Type a name for the printer; for example `HPLaserJetMac`.

When you type the URI for the printer, the first part of the name automatically appears in the **Name** field. You can change that name now. This is the name that will appear in the list of printers in the Print and Scan system preference and in the list of available printers when a

user prints a document. It is also the name of the PPD (Postscript Printer Description) file that the CUPS facility creates for each printer that is added to your Printer preferences.

Type an optional description in **Location** to assist users in locating the printer.

6. In the **Print Using** window, specify the type of the printer, which enables you to properly manage the printer.

For example, if you have drivers installed for the printer, click **Select Printer Software** and select the appropriate item such as **HP Laserjet 4300**, then click **OK**.

You can also specify **Generic Postscript Printer**, or click **Other** to browse for drivers or printer software.

Click the **Add** button to add the printer to the list of available printers.

7. Repeat this procedure for as many printers as you want to make available for authenticated printing.

You can now use the Copy Files group policy to copy the new *printerName.ppd* file and updated CUPS configuration file (*printers.conf*) to the appropriate locations on each of your Mac computers in the domain.

To copy printer files to other computers

1. In the Finder on the Mac template computer, navigate to the `/etc/cups` directory by clicking **Go > Go to Folder**, then type `/etc/cups` and click **Go**.
2. Select `printers.conf` and copy it to the desktop. When prompted, enter your administrator password to copy the file.
3. Open the `ppd` folder (`/etc/cups/ppd`). Select the files for all the authenticated printers you defined in the previous procedure and copy them to the desktop.
4. On the desktop, change the file permissions for the `printers.conf` and `*.ppd` files so you can copy them to sysvol:
 - a. Select the files and click **File > Get Info**.
 - b. For each open dialog box, expand **Sharing & Permissions**, then click the lock icon and provide administrator credentials for making

changes. Set the permissions for **everyone** to **Read only**.

c. Reset the lock and close all the open dialogs.

5. On the Windows domain controller create a sub-directory for the printer file in SYSVOL.

SYSVOL is a well-known shared directory on the domain controller that stores server copies of public files that must be shared throughout the domain. You can use it to copy the printer definition and configuration files to all Mac computers that join the domain.

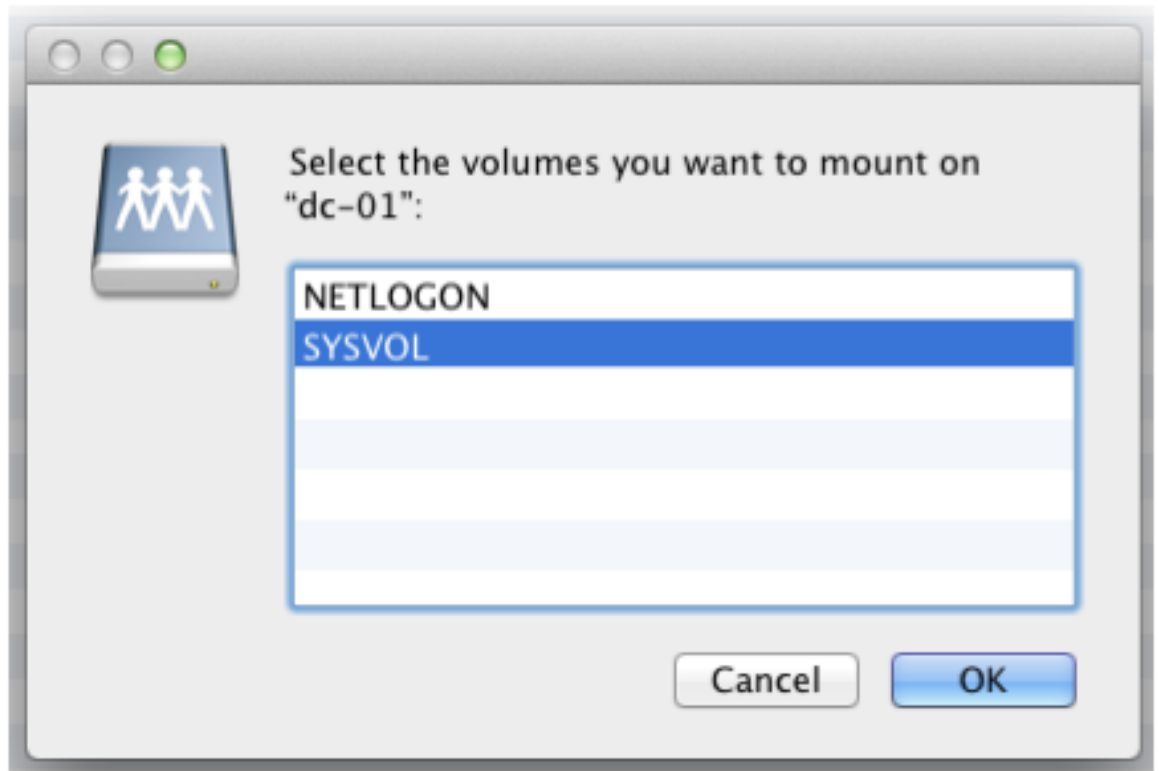

SYSVOL is located at:

```
C:\Windows\SYSVOL\sysvol\domainName\
```

For example, assuming the domain is `acme.com`, and using the name `MacPrinters` for the directory, create the following directory:

```
C:\Windows\SYSVOL\sysvol\acme.com\MacPrinters
```

6. On the Mac computer, copy the files from the desktop to SYSVOL on the Windows domain controller. If you are connected to the domain, you should see the domain controller in the Finder. If the domain controller is not visible in the Finder, connect to it:
 - a. Click **Go > Connect to Server** and select the domain controller.
 - b. When prompted select SYSVOL; for example:

- c. Navigate to the MacPrinters directory you created, for example by clicking **acme.com** then **MacPrinters**.
 - d. Drag the printer files to MacPrinters.
7. Configure the Copy Files group policy.
- a. On the Windows domain controller, open the Group Policy Management Editor and select the GPO that is used to manage Mac computers.
 - b. Navigate to **Computer Configuration > Policies > Common UNIX Settings** and double-click **Copy Files**.
 - c. In **Copy file policy setting**, select **Enabled**.
 - d. Click **Add**, then **Browse**. Double-click to open the directory you created for the printer files in [Understanding printing on Mac OS X](#) (for example, MacPrinters).
 - e. Select the `printers.conf` file. Filename now shows `MacPrinters/printers.conf`.
 - f. In **Destination**, type `/etc/cups`. This group policy will copy `printers.conf` to the `/etc/cups` directory of each computer that joins the domain.

- g. Select **Use destination file ownership and permissions**. The file will be assigned the default ownership and permissions:
 owner: root (0)
 group: lp (26)
 permission 0600 (rw- --- ---)
- h. Select **OK** to add the `printers.conf` file.
8. Click **Add** again and browse to MacPrinters to add the PPD files.
 - a. Select one of the PPD files you copied to the MacPrinters directory.
 - b. In **Destination**, type `/etc/cups/ppd`.
 - c. Select **Use destination file ownership and permissions**. The file will be assigned the default ownership and permissions:
 owner: root (0)
 group: lp (26)
 permission 0644 (rw- r-- r--)
 - d. Click **OK** to add the file.
9. Repeat the sub-steps in Step 8 for each of the PPD files that you have defined, then click **OK** to enable the policy.
 This group policy will copy each *printerName*.ppd file to the `/etc/cups/ppd` directory of every computer to which the policy applies and that is joined to the domain.
10. Run the `adgupdate` command on each target Mac computer to trigger an update of group policies and execute the new Copy Files policy.
 By default, group policies are updated automatically every 90 minutes, so you can skip this step and wait for the automatic update if you wish. You should also log out and back in again on each computer to update the printer configuration dialogs.

Removing a printer definition from client computers

This section explains how to remove printer definitions that you created for Mac computers in the domain. It assumes that you set up the Copy Files group policy to add printer definitions to each of your joined Mac computers (as explained in [Setting up authenticated printing](#)).

To remove a printer definition from computers in a domain

1. Identify the name of the PPD file to delete in `/etc/cups/ppd`; for example, `laserjet4300.ppd`.
2. On the Mac template computer (the computer on which you originally defined the authenticated printer), open **System Preferences > Print & Scan**. Select the printer to delete, click the minus (-) button, then click **Delete Printer**.

Deleting the printer removes the printer from the list, updates the `/etc/cups/printers.conf` file by removing the definition of the deleted printer, and removes the `printerName.ppd` file from the `/etc/cups/ppd` directory.

3. Copy the updated `printers.conf` file to the desktop and change the permissions to **everyone: Read only**.
4. Copy the updated `printers.conf` file to the SYSVOL and replace the existing file; also remove the PPD file for the deleted printer.

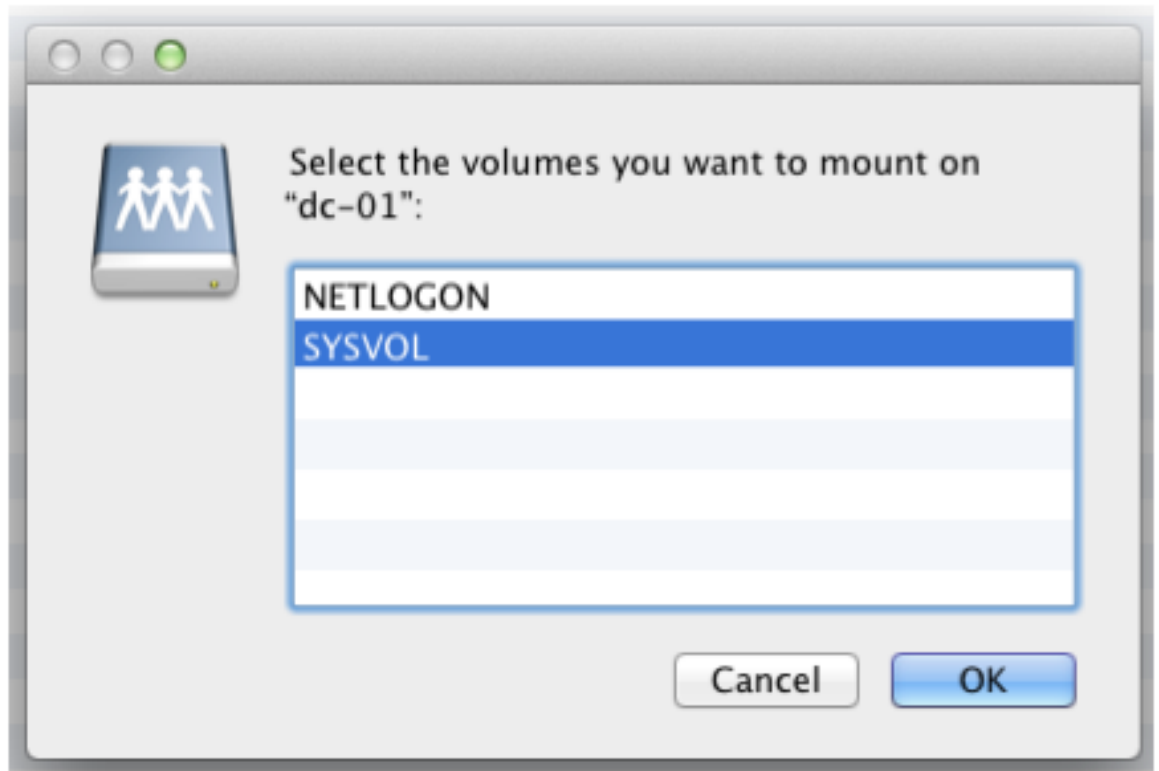

SYSVOL is a well-known shared directory on the domain controller that stores server copies of public files that must be shared throughout the domain. When authenticated printing was set up, the CUPS configuration file, `printers.conf` was placed in the `SYSVOL/acme.com/MacPrinters` folder.

SYSVOL is located at:

```
C:\Windows\SYSVOL\sysvol\domainName\
```

If you are connected to the domain, you should see the domain controller in the Finder. If the domain controller is not visible in the Finder, connect to it:

- a. Click **Go > Connect to Server** and select the domain controller.
- b. When prompted, select **SYSVOL**; for example:

- c. Navigate to the directory you created (*domainName/subdirectory*), for example by clicking **acme.com** then **MacPrinters**.
 - d. Drag the printer configuration file to this directory.
 - e. Remove the PPD file for the deleted printer.
5. Remove the deleted *printerName.ppd* file from the Copy Files policy.
 - a. On the Windows domain controller, open the group policy editor and select the policy to edit, such as **Default Domain Policy**.
 - b. Navigate to **Computer Configuration > Policies > Common UNIX Settings** and double-click **Copy Files**.
 - c. Select the file to delete and click **Remove**.
 - d. Click **OK** to save the updated policy.
6. Configure the **Specify commands to run** group policy to remove the deleted *printerName.ppd* file from all the Mac computers in the domain.
 - a. In the same folder of the group policy editor (Common UNIX Settings), open the Specify commands to run policy and select **Enabled**.
 - b. Click **Add**.

- c. In **Run command**, enter a command similar to the following to remove the *printerName*.ppd file from the /etc/cups/ppd directory on each computer:

```
rm /etc/cups/ppd/printerName.ppd; for example:
```

```
rm /etc/cups/ppd/laserjet4300.ppd
```

- d. Click **OK** to save the policy.

The next time group policy is updated on computers in the domain (every 90 minutes by default), the following occurs:

- The Copy Files group policy copies the updated `printers.conf` file to each computer.
- The Specify commands to run group policy removes the specified PPD file on each computer.

Setting up local and remote administrative privileges

Centrify provides two group policies to set administrative privileges on the local computer:

- [Map zone groups to local admin groups](#) allows you to specify one or more zone groups to map to the local admin group. Members of the specified group are given administrative privileges on Mac computers managed by Access Manager.
- [Enable administrator access groups](#) allows users in the zone group *ard_admin* to access a computer via Apple Remote Desktop with full privileges.

This section shows you how to use these policies together to enable local and remote administrative access to Mac computers.

To enable remote and local access for a group:

1. Create an Active Directory group, for example, *My_Mac_Admins*, and add users who you want to have administrative privileges.

2. Create an Active Directory group that is a Domain Local Security group. For convenience, name it *ard_admin*.
3. Add *My_Mac_Admins* as a member of *ard_admin*.
4. Create a Centrify zone group, *My_Mac_Admins* and map it to the Active Directory group *My_Mac_Admins*.

Note If the local computer is connected to the domain through Auto Zone, you cannot create a zone group because there are no zones. However, all Active Directory groups are valid for the joined computer, so you can map any group, such as *My_Mac_Admins*, to the local admin group, but you need to know the group's UNIX name, which you can retrieve on the local computer, by using the `adquery` command, as follows

```
[root]#adquery group -n
```

For example, the following shows an `adquery` command and the name it returns:

```
[root]#adquery group -n |grep -i Mac_Admins
my_mac_admins
```

5. Create a zone group, *ard_admin*, and map it to the Active Directory group *ard_admin*.

Note This zone group must be named *ard_admin*.

6. In the Group Policy Editor, edit the group policy for the domain, then click **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Accounts > Map zone groups to local admin group**.
7. Open the policy, select **Enable**, then click **Add**. Enter *My_Mac_Admins* (or the name retrieved from the `adquery -n` command in Step 4), then click **OK**.

This step maps *My_Mac_Admins* to the admin group on the local computer and gives members of *My_Mac_Admins* all privileges.

8. Click **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Remote Management > Enable administrator access groups**.
9. Open the policy and select **Enable**.

This step allows members of *ard_admin* to access a computer via Apple Remote Desktop with full privileges. In Step 7, you effectively gave

members of *My_Mac_Admins* administrative privileges. Since *My_Mac_Admins* includes members of *ard_admin*, members of *ard_admin* now have full local and remote administrative access.

Querying user information for Active Directory users

When you run commands or use applications that look up user information in the directory, the local Mac directory service is always consulted first before the look-up request is made to Active Directory. If a local user exists with the same name as a UNIX profile name that has been defined for the zone, a lookup request such as `id username` will return the UID and GID associated with the local user account from the local directory service rather than the information associated with the UNIX profile defined in Active Directory.

For example, if you have a UNIX profile in Active Directory for the user *mia* with the UID of 10024 and the user's primary group is *mia* with the GID of 10024 and the user is also a member of the Active Directory group *users* and GID of 10001, running the `id mia` command returns the following information from Active Directory:

```
uid=10024(mia) gid=10024(mia) groups=10024(mia), 10001
(users)
```

However, if there is also a local user account with the same user name of *mia*, but with a UID of 502 and a primary group named *mia* with a GID of 502, running `id mia` returns the information for the local user retrieved from the Mac directory service, then any additional group membership information retrieved from Active Directory. For example:

```
id mia
uid=502(mia) gid=502(mia) groups=502(mai), 10001(users)
```

Because the Mac directory service is queried first, the information for the local user *mia* takes precedence over the information defined in Active Directory. To avoid retrieving the information for a local user instead of the UNIX profile defined in Active Directory, you should make sure that the UNIX profile user names in Active Directory are different from the local user or disable local user accounts.

Migrating from Open Directory to Centrify Active Directory

If you install the Centrify agent in an environment where existing Mac users and computers are managed with Open Directory, you may need to migrate the account information and home directories for those users from the Open Directory environment to Centrify Active Directory. Open Directory and Active Directory support three types of users:

- Local users
- Network home users
- Portable home, or mobile home, users

For example, you may need to migrate existing mobile user accounts from Open Directory to Active Directory or migrate local home directories to a network share.

To migrate users with existing mobile accounts from Open Directory to Active Directory:

1. Create a copy of the user's local home directory in a temporary location if you have enough disk space to do so. This copy can serve as a backup to restore the user's home directory if you run into any synchronization problems.
2. Log on to the Mac client as an administrator.
3. Disable the LDAP service.

Open the Directory Utility and select the **Services** tab; then deselect **LDAPv3** and click **Apply**.

4. Open a Terminal window and run the following Directory Service command to delete the user's record:

```
dscl /Local/Default -delete /Users/userName
```

where *userName* is a local user; for example, to delete the record for cain:

```
dscl /Local/Default -delete /Users/cain
```

5. Navigate to the `/Users/user_name/Library/Mirrors` directory and delete this folder.

6. Join the Mac computer to an Active Directory domain and restart the computer to shut down and restart services.
7. Create an Active Directory user account for the Open Directory user account, if one does not already exist.

If you are creating a new Active Directory user, use Active Directory Users and Computers to add the user account.

8. Add the Active Directory user to the Mac computer's zone and define the Centrify Profile for the user:
 - Use the same user name, UID, and GID as the Open Directory user account. You can change this information later with the `adfixid` program, but for migration you must use the same values.
 - Set the home directory for the user to the appropriate network share using the `/SMB/share/path` or `/AFP/share/path` syntax. For example, `/SMB/cain/server2003.myDomain.com/Users/cain`.

Note For synchronizing new mobile user accounts, the empty home directory must exist on the network share. If the user home directories are on the same network share as you previously used with Open Directory, logging on with the new Active Directory account should not affect the files available on the share.

Because GID values of 0 to 99 are usually reserved for system accounts, you may see a warning message when you save the user's profile if the user's primary GID value is less than 99.

9. Create a Group Policy Object and link it to an organizational unit that includes the Active Directory users and enable the following policies:
 - **Enable/disable synchronization** to create a new mobile account for the users.
 - **Enable/disable background synchronization rules** to activate background synchronization rules.
 - **Items that will be synchronized in the background**, then click **Show > Add**, and type the tilde character (~) to synchronize the home folder.
 - **Enable/disable login & logout synchronization rules** and **Items**

that will be synchronized at login and logout to activate login and logout synchronization rules.

10. Log on to the Mac computer with the Active Directory or zone user account name and password to create a mobile account for this user. If prompted to confirm the creation of the a portable home directory, click **Yes**. If logging in is successful and the mobile account is created, the files and folders you have specified using the **User Configuration > Policies > Centrify Settings > Mac OS Settings > Mobility Synchronization Settings > Synchronization Rules: Background Sync** group policies are synchronized from the `/Users/user_name` folder to the network share you have defined. For example, `/SMB/cain/server2003/Users/cain`.

After the initial synchronization of background items, any files and folders you have specified using the **Items that will be synchronized at login and logout** group policy are synchronized from the `/Users/user_name` folder to the network share folder.

If you have Open Directory users that do not have mobile accounts or portable home directories and you want to synchronize their local home directories with their network home, you should first use the Workgroup Manager to create mobile accounts for those users to establish a portable home directory. You can then follow the steps above to synchronize the portable home directories with their network home directory. If you don't want to synchronize the local home directory with the home directory on the network share, you can simply create Active Directory accounts for the Open Directory users and remove the local user records; see [Mapping local user accounts to Active Directory](#) for information about removing local user records.

Changing the Centrify UIDs and GIDs

To change the UID and GID values in Centrify Active Directory to match the existing values:

1. Log in to the Mac computer as a local administrator.
2. Open a terminal session.

3. Open the user's home folder and type:

```
ls -ln total 32
-rw-r--r--@ 1 505 505      3 Mar 26 2007
.CFUserTextEncoding
-rw-r--r--@ 1 505 505 6148 Mar 26 2007 .DS_Store
-rw----- 1 505 505   74 Mar 26 2007 .bash_
history
drwx-----@ 3 505 505  102 Mar 26 2007 Desktop
drwx-----@ 3 505 505  102 Mar 26 2007 Documents
drwx-----@ 19 505 505  646 Mar 26 2007 Library
drwx-----@ 3 505 505  102 Mar 26 2007 Movies
drwx-----@ 3 505 505  102 Mar 26 2007 Music
drwx-----@ 4 505 505  136 Mar 26 2007 Pictures
drwxr-xr-x@ 4 505 505  136 Mar 26 2007 Public
drwxr-xr-x@ 5 505 505  170 Mar 26 2007 Sites
```

The third column shows the UID (505 in this example) and the fourth column shows the GID (also 505).

4. On the Windows workstation, open the Access Manager console. Expand the zone, expand users, and double-click the user to open the property page.
5. Type 505 for the UID.
6. To change the GID, you need to either change the GID of the group to which the user belongs (which will change for all users who belong to that group) or create a new group. To create a new group:
 - Open ADUC. Then right-click **Users > New > Group**. Enter a name for the group and click **OK**.
 - In the Access Manager console, right click **Groups > Create UNIX Group**. Search for the group you created. Change the GID to the desired value (for example, 505) and click **OK**.
7. To change the GID of the existing group to which the user belongs, expand **Groups** and double-click the group name. Change the GID to the desired value (for example, 505). Click **Yes** on the warning message.

Modifying the Mac UID and GID to match Centrify

To change the existing UID and GID to match the values in Centrify Active Directory depends on whether you have a local home directory, a network

• • • • •

home directory, or a mobile home directory.

To change the existing UID and GID if you have a local home or network home directory:

1. Log in to the Mac computer as a local administrator.
2. Open **Applications > Directory Utility > Services**. Double-click **Active Directory**, then click **Unbind**. Enter your administrator name and password if necessary.
3. Use the ADJoin tool (either the GUI or the command-line version) to connect to an Active Directory domain.
4. Open a terminal session and type the following:

```
id userName
```

Note the primary group. For example:

```
id cain
...
gid=10000 (support)
```

5. Type:

```
chown -R userName:primaryGroupName /Users/userName
```

For example, for a local home directory:

```
chown -R cain:support /Users/cain
```

For example, for a network home directory:

```
chown -R cain:support /SMB/Users/cain
```

To change the existing UID and GID if you have a mobile home directory:

1. Be certain the local home directory is synchronized with the network home directory.
2. Log in to the Mac computer as a local administrator.

3. Open **Applications > Directory Utility > Services**. Double-click **Active Directory**, then click **Unbind**. Enter your administrator name and password if necessary.

4. Use the ADJoin tool (either the GUI or the command-line version) to connect to an Active Directory domain.

5. Open a terminal session and type the following Directory Service command to delete the cached local user:

```
dscl . -delete /Users/userName
```

For example:

```
dscl . -delete /Users/cain
```

6. Then type the following commands to remove the home directory so that it syncs again from the network and remove the local copy of mcx so you are prompted to create a mobile account:

```
rm -rf /Users/userName
```

```
rm -rf /Library/Managed\ Preferences/userName
```

7. On the Windows Active Directory computer, set the **User Configuration > Policies > Centrify Settings > Macintosh Settings > Mobility Synchronization Settings** group policies.

Converting a local user to a Centrify Active Directory user

Although local user accounts can co-exist with Active Directory user accounts, in some cases, you may want to convert some or all of your local accounts to Active Directory user accounts. Converting local users to Active Directory users simplifies account management, but requires you to take some steps manually.

On Mac computers, the local account database is always checked for authentication before Active Directory. If a local user has the same username as an Active Directory user, the local user account is used for authentication. If the local user's password is different from the Active Directory user's password whether logging on using the Mac login window, or remotely (for example, using telnet or ssh), the local user password is required for authentication to succeed. Although authentication succeeds, Access Manager will generate a username conflict warning.

In most cases, you should remove or convert local user accounts to avoid conflicts between Active Directory and local user accounts and to ensure Active Directory password and configuration policies are enforced. If you need to keep local user accounts, you should ensure the logins are distinguishable from Active Directory accounts. For more information about removing local user accounts, see [Mapping local user accounts to Active Directory](#).

To convert a local Mac user to an Active Directory user:

1. Open a Terminal window and run the following Directory Service command to delete the user's record:

```
dscl /Local/Default -delete /Users/userName
```

where *userName* is a local user; for example, to delete the record for cain:

```
dscl /Local/Default -delete /Users/cain
```

Although the user record is deleted, the home directory for the user (/Users/cain), including all sub-directories and files, still exists. When you create an Active Directory user with the same name, this user will have access to everything in the existing local home directory.

2. On a Windows computer, use Active Directory Users and Computers to create an Active Directory user account for the local user account (for example, cain), if one does not already exist.
3. In the Access Manager console add the Active Directory user to the appropriate zone and define the Centrify Profile for the user. Set the home directory for the user:

Note The default home directory for Mac users is the /Users directory, unlike most UNIX systems where /home is the default by convention.

- To a local home directory: /Users/*userName*; for example, /Users/cain.
- To an appropriate network share using the /SMB/*share/path* or /AFP/*share/path* syntax. For example, /SMB/cain/server2003.myDomain.com/Users/cain. See [Configuring a network home directory](#).

- To a network home directory. If you wish to create a mobile account for the user and synchronize the user's folders the next time the user logs on, see [Configuring a portable home directory](#).
4. Reboot the Mac computer, then log in as the new Active Directory user.

Migrating a user from Apple's Active Directory plugin to Centrify Active Directory

When you create an Active Directory user by using the Mac Directory Utility Active Directory plug-in it creates numeric user (UID) and group (GID) identifiers. When you migrate a current Active Directory user to Centrify Management Services for Mac, the Access Manager console creates a UID and GID that are different than the current UID and GID. When an Active Directory user attempts to log in after the agent is installed, the changed UID and GID cause ownership and permission problems with the user's home directory.

There are two basic approaches to solving this problem:

- [Changing the Centrify UIDs and GIDs](#)
- [Modifying the Mac UID and GID to match Centrify](#)

Using Apple's scheme to generate UIDs and GIDs for Mac users

By default, Centrify uses a different scheme than the Apple Active Directory plugin to generate numeric user (UID) and group (GID) identifiers for Mac users added to Active Directory. If you use the default Centrify scheme to generate identifiers, you must resolve UID and GID conflicts after migrating users. For example, after migrating you can change ownership on the existing files (see [Modifying the Mac UID and GID to match Centrify](#)) otherwise users have Centrify-generated UIDs whereas their files belong to Apple-generated UIDs so users will be unable to access files and folders in their home directories.

On the other hand, Centrify allows you to use the Apple scheme, rather than the default Centrify scheme, to create UIDs and GIDs for migrated users. This method ensures compatibility with Mac tools, such as ExtremeZ-IP, that

• • • • •

require UIDs and GIDs generated with the Apple scheme, not the Centrify scheme.

This section explains how to create Apple-generated UIDs and GIDs for Mac users who you are adding to Active Directory with Centrify Management Services for Mac when a computer is connected to Centrify Active Directory through Auto Zone.

Note If your computer is joined to a zone, however you are adding users to the zone, you can choose to use the Apple scheme to generate UID and GID values. For example, you can specify the Apple scheme with `adedit`, with the Zone Provisioning Agent, and in the Access Manager Console.

Centrify provides the `auto.schema.apple_scheme` parameter to enable use of the Apple schema for generating UIDs for new users. The recommended way to set this parameter is by way of group policy so that you can set it for a group of computers. You may also set the parameter on individual computers by editing the Centrify configuration file.

To use group policy to enable the Apple scheme for generating UIDs and GIDs:

1. If you are generating new UIDs and GIDs for files that reside remotely in AFP or NFS mounted shares, back up the UIDs and GIDs on the computer where the share resides by executing a command similar to the following:

```
adquery user > olduid
```

Note You do not need to perform this step for Samba shares.

2. On a Windows computer, open the Group Policy Management Editor and edit a group policy object that applies to Mac computers.
3. Expand **Computer Configuration > Policies > User Configuration > Policies > Centrify Settings > Direct Control Settings > Adclient Settings**, and double-click **Generate New uid/gid using Apple scheme in Auto Zone**.
4. Select **Enabled** and click **OK** to set the policy.

To edit the configuration file and enable the Apple scheme for generating UUIDs and GIDs on a single computer:

1. If you are generating new UUIDs and GIDs for files that reside remotely in AFP or NFS mounted shares, back up the UUIDs and GIDs on the server where the computer resides by executing a command similar to the following:

```
adquery user > olduid
```

Note You do not need to perform this step for Samba shares.

2. Log in to a Mac computer.
3. Edit the Centrify configuration file: `/etc/centrifydc/centrifydc.conf`.
4. Find the following parameter, remove the comment and set its value to `true`:

```
auto.schema.apple_scheme: true
```

You may also enable the Apple scheme to set the primary GID for users if you wish.

Note You may set the primary GID in this way only if the parameter `auto.schema.private.group` is set to `false`. Otherwise, the primary GID is set to the value of the user's UID.

To enable the Apple scheme for generating the primary GID:

1. If you are generating new UUIDs and GIDs for files that reside remotely in AFP or NFS mounted shares, back up the UUIDs and GIDs on the computer where the share resides by executing a command similar to the following:

```
adquery user > olduid
```

Note You do not need to perform this step for Samba shares.

2. In the Group Policy Management Editor, edit a group policy object that applies to Mac computers, expand **Computer Configuration > Policies > User Configuration > Policies > Centrify Settings > Direct Control Settings > Adclient Settings**, and double-click **Set user's primary gid in Auto Zone**.

3. Select **Enabled**.
4. In **Set user's primary gid in Auto Zone**, type -1.

The primary GID for each user will be generated by the Apple scheme, as specified with the "Generate New uid/gid using Apple scheme in Auto Zone" group policy, which you enabled in the previous procedure.

5. Click **OK** to save the setting.

After setting these policies, run `adgupdate` to update the group policies you just set, and flush the cache on each joined computer to update the UID and GID values for any existing users.

To flush the cache on each Mac OS X computer:

1. Log in to a Mac computer and open the Terminal application.
2. Execute the following command as root:

```
adflush
```

New users who you migrate to Active Directory from the Apple Active Directory plug-in will automatically keep the same UID, GID, and primary GID values that they had before migration, and their home ownership will work properly.

After you flush the cache, any existing users and groups will have their UID, GID, and primary GID values changed from the Centrify scheme to the Apple scheme. However, ownership of files and folders in home directories will still belong to the Centrify UID and GID. To change ownership to the new UID and GID generated by the Apple scheme, run the `fixhome.pl` script as explained in the following procedure.

To correct file ownership by running `fixhome.pl`:

Note If you generated new UIDs and GIDs for files that reside remotely in AFP or NFS mounted shares, the `fixhome.pl` script does not have permission to change UIDs and GIDs in the share, and you must manually update the UIDs and GIDs on the server where the share folders reside. In this scenario, go to [Workaround for AFP and NFS mounted shares](#) and continue from there.

For Samba shares and local UIDs and GIDs:

1. Log in on a Mac computer for which you have changed UID and GID values to the Apple scheme.
2. Execute the following command as root:

```
/usr/local/share/centrifydc/sbin/fixhome.pl
```

The script changes ownership of files and folders in the home directory of all Centrify Active Directory users from the Centrify-generated UID or GID to the Apple-generated UID or GID.

The script uses `/Users` as the root for all home directories. You may specify a different home root if necessary by using the `--dir` option. Use the `--help` option to see a list of options that you can specify with this command:

```
/usr/local/share/centrifydc/sbin/fixhome.pl --help
```

For example, you can run the command in test mode to see the changes that will be made, but without committing the changes:

```
[root]#/usr/local/share/centrifydc/sbin/fixhome.pl --test
```

User	Home	UID Map	GID Map
user1	/Users/user1	796918879=>558948313	
		20=>5287576209	

Or you could update specific users rather than all users:

```
[root]#/usr/local/share/centrifydc/sbin/fixhome.pl --include user2
```

Workaround for AFP and NFS mounted shares

For AFP and NFS mounted share folders (or remote file systems), `fixhome.pl` does not have permission to change the UID/GID of files in the folder. Perform the following steps to work around this issue:

1. On the server where the share folders reside, open the UID/GID backup file to have access to the old UID/GID strings.
2. On the server where the share folders reside, change the old UIDs and GIDs to the new UIDs and GIDs one at a time by executing commands similar to the following:

```
find ShareFolder -user previous_uid -group previous_gid -exec chown new_uid:new_gid {} \;
```

To enable the Apple scheme for mobile users:

Additional steps are required to enable the Apple scheme for mobile users. After enabling the Apple scheme as described in the preceding sections, you must ensure that the UID and PGID for the mobile user's local user record match the UID and PGID used by the Centrify agent.

1. Change the UID and PGID in the local user record so that they match the IDs used by the agent:
 - a. Open **Users and Groups**.
 - b. Right-click the mobile user account.
 - c. Choose **Advanced Options**, and change the UID and PGID so that they match the IDs used by the agent.
2. After changing the UIDs and PGIDs of mobile users, run the `fixhome.pl` script as described in [To correct file ownership by running fixhome.pl](#).

To use the Zone Provisioning Agent to enable the Apple scheme for generating UIDs and GIDs:

1. Ensure that the Zone Provisioning Agent is configured as described in the section "Configure the Zone Provisioning Agent" in the *Planning and Deployment Guide*.
2. Ensure that zone provisioning groups are created and configured as described in Chapter 8, "Preparing the environment for migration of existing users and groups" in the *Planning and Deployment Guide*.
3. Start Access Manager.
4. In the console tree, expand the **Zones** node.
5. Select the top-level parent zone, right-click, then click **Properties**.
6. Click the **Provisioning** tab.
7. Click **Enable auto-provisioning for group profiles**.
8. Click the Find icon to search for and select the primary group (typically the `Domain Users` group) as the Source Group.
9. Select **Generate using Apple scheme** as the method for assigning a new GID to new UNIX group profiles.

This method generates group GIDs based on the Apple algorithm for generating numeric identifiers from the Active Directory group's objectGuid. This option is only supported for hierarchical zones.

10. Select a method for assigning a new group name to new UNIX group profiles:
 - **SamAccountName attribute** generates the group name for the new UNIX group profile based on the samAccountName value.
 - **CN attribute** can be used if you verify the common name does not contain spaces or special characters. Otherwise, you should not use this option.
 - **RFC 2307 attribute** can be used if you have added the RFC 2307 groupName attribute to Active Directory group principals. Otherwise, you should not use this option.
 - **Zone default value** to use the setting from the Group Defaults tab for the zone. In most cases, the default is a variable that uses the SAMAccountName attribute.
 - By default, all UNIX group names are lowercase and invalid characters are replaced with underscores.
11. Click **OK** to save your changes.

Mapping local user accounts to Active Directory

In most environments, you can map local user accounts to Active Directory accounts to manage the passwords for local users using your Active Directory password policies. Although you can map local Mac OS user accounts to Active Directory accounts with the User Map group policy, Mac OS users can still log on (through the Mac login window, or remotely by using telnet or ssh) by using their local account password, so you cannot effectively use Active Directory to enforce your password policies for local Mac OS user accounts.

To enforce Active Directory password policies for Mac users, you need to delete the local user accounts to prevent those local account names and passwords from being used to log on.

There are different ways to delete local accounts that will impact how those users' home directories are handled. To delete local user accounts on Mac computers, do one of the following:

- Click **Systems Preferences > Accounts**, select the account and click the minus (-) sign, then click **OK**. Deleting the user account in this way moves local user's home directory to `/Users/Deleted Users/localuser.dmg` and the user account and home directory are made inactive. If you click **Delete Immediately** instead of OK, the home directory will not be saved in the `/Users/Deleted Users` folder.
- Open a Terminal window and run the following Directory Service command to delete the user's record:

```
dscl /Local/Default -delete /Users/userName
```

where *userName* is a local user; for example, to delete the record for *cain*:

```
dscl /Local/Default -delete /Users/cain
```

Deleting the user account in this way leaves the user's home directory in place. If the Active Directory user you enable for UNIX is configured with the same UID and GID as the deleted local user, the Active Directory user will assume ownership of the home directory.

Configuring auto-enrollment

Centrify uses the Microsoft Windows certificate auto-enrollment feature to make certificates available to UNIX and Mac computers. If auto-enrollment is enabled, when a UNIX or Mac computer joins a domain, certificates are requested from the Certification Authority based on particular templates, and the certificates are installed on the joined computer.

To enable auto-enrollment, you must do the following:

- Enable auto-enrollment for the group policy.
- Create a certificate template with auto-enrollment enabled.

For details about enabling auto-enrollment, including how to perform these procedures, see "Configuring a Certificate Authority for auto-enrollment," in the *Isolation and Encryption Service Administrator's Guide*.

Configuring 802.1X wireless authentication

This section explains how to configure Active Directory and Mac to authenticate Active Directory users by using a Microsoft RADIUS server with the 802.1X PEAP (MSCHAPv2) protocol over a wireless network from a Mac computer.

On Mac OS X, 802.1X wireless authentication does not rely on Centrify Access Manager or Apple's Active Directory plugin but is configured primarily through group policies that apply to the Windows server and the Mac computers.

System configuration for 802.1X wireless authentication

The following table summarizes the environment that is needed for 802.1X wireless authentication:

Environment Components / Configuration	
Windows side	<p>Windows Server 2003 R2 Enterprise Edition Domain Controller (supports PEAP) with Internet Authentication Service (IAS) installed; on Windows server 2003, RADIUS server is part of IAS.</p> <p>or</p> <p>Windows Server 2008 R2 Enterprise Edition Domain Controller (supports PEAP/TLS) with Network Policy Server (NPS) installed; on Windows Server 2008, Radius server is part of NPS.</p> <hr/> <p>Active Directory on the Windows Server</p> <hr/> <p>Group Policy Management Console (GPMC), which is required to configure 802.1x group policies and deploy certificates.</p> <hr/> <p>Certificate Services, which is required to obtain the required certificates.</p> <hr/> <p>Access Manager console 5.1.x or later, which is required to set group policies that apply to Mac computer.</p>
Mac side	Centrify agent 5.0.1-171 or later to enforce group policies on the Mac computer.
Wireless access point device	<p>Supports 802.1x wireless authentication through one of these protocols:</p> <ul style="list-style-type: none"> ■ WPA Enterprise

Environment Components / Configuration

- WPA2 Enterprise
 - 802.1X WEP (the name can be different, for example, RADIUS)
-

Note Although it is possible to configure other RADIUS servers for 802.1X wireless authentication, or use other protocols, this document focuses on the Microsoft RADIUS server and the PEAP and TLS protocols.

The assumption of this document is that you have a RADIUS server properly configured for 802.1X wireless authentication and can now proceed to configure your Mac environment. The following is a list of how the RADIUS server must be configured to support 802.1X wireless authentication on Mac OS X. Click a link if you have questions about whether your RADIUS server is configured properly with regard to any particular item:

- [Confirming that the Windows server \(Certificate Authority\) is set up properly to support auto-enrollment of certificates on Mac computers](#)
- [Confirming that the Windows server \(Certificate Authority\) is set up properly to support auto-enrollment of certificates on Mac computers](#)
- [Confirming that the Windows server \(Certificate Authority\) is set up properly to support auto-enrollment of certificates on Mac computers](#)
- [Confirming that the Windows server \(Certificate Authority\) is set up properly to support auto-enrollment of certificates on Mac computers](#)

Of course, there are other configuration steps that are required to set up a RADIUS server, such as configuring the RADIUS client and configuring a remote access policy, however, the important consideration for Mac 802.1X authentication is that the specified certificate and private key have been created and deployed to the domain. When a Mac computer joins a Windows domain, Access Manager automatically finds certificates on the Domain Controller and adds them as trusted certificates to Keychain Access on the Mac computer.

Once you are certain that the RADIUS server is properly configured, you can configure your Mac environment; see the following section for instructions on configuring OS X 10.7 or later.

Configuring Mac OS X 10.7 or later for 802.1X wireless authentication

Mac OS X 10.7 changed the way to create and manage profiles such that configuring 802.1X wireless authentication varies significantly between 10.7 and earlier versions of OS X. This section explains how to configure a Mac OS X 10.7 or later computer for 802.1X wireless authentication.

Before configuring your Mac environment, be certain that the RADIUS server is configured as described in [System configuration for 802.1X wireless authentication](#). This configuration includes a domain root CA certificate or RAS/IAS server certificate, as well as a private key that are required to be trusted on the Mac computer.

However, there are no manual steps that you must perform to trust these certificates on your Mac computers. As mentioned previously, when a computer is joined to a domain, Access Manager automatically looks for certificates on the domain controller, and adds these certificates and the private key to the system Keychain on the Mac computer.

Through group policy settings you can use these certificates to create two different types of system profiles

- A profile that allows users to authenticate to an 802.1X-protected ethernet network — see the next procedure: [To configure Mac OS X 10.7 or later to create an 802.1X Ethernet profile](#).
- A profile that allows users to authenticate to an 802.1X wireless network — see the procedure: [To configure Mac OS X 10.7 or later to create an 802.1X WiFi profile](#).

The certificate template — as well as a certificate chain file and private key — are pushed to `/var/centrify/net/certs` on the Mac computer when it joins the domain. Before you configure the group policy for the Mac computer, if you want to verify that auto-enrollment is operating correctly, you can open a Terminal window on the Mac computer and run a command similar to the following to check that the certificate has been downloaded to the computer:

```
admin$ls /var/centrify/net/certs |grep -i auto_
...
auto_TemplateName.cert
auto_TemplateName.chain
auto_TemplateName.key
```

You should see three auto_ files as shown in the example.

To configure Mac OS X 10.7 or later to create an 802.1X Ethernet profile

1. On a Windows computer, open the Group Policy Management Editor and edit a group policy object that applies to Mac computers.
2. Expand **Computer Configuration > Policies > User Configuration > Policies > Centrify Settings > Mac OS X Settings > 802.1X Settings**, and double-click **Enable Ethernet Profile**.
3. Select **Enable**, then click **Add**.
4. Type the name of the auto-enrollment machine certificate that has been pushed down from the Windows domain server.

When pushed to a Mac computer, certificate names are prepended with auto_; for example:

auth_Centri fy-1x

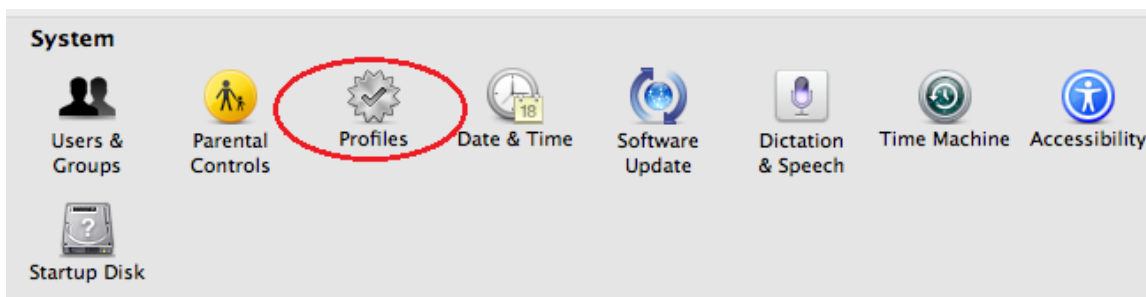

This group policy runs a script that looks for the specified certificate template in the /var/centri fy/net/certs directory (which contains the certificate templates pushed down to Mac when they join the domain) and creates a WiFi profile from this certificate.

5. Click **OK** to save the profile information and **OK** again to save the policy setting.

Note This group policy will take effect at the next group policy update interval, or you can run `adgpupdate` in a Terminal window on the Mac computer to have the policy take effect immediately.

When the group policy takes effect, it runs a script to create an ethernet profile for the computer from the certificate template and private key downloaded from the domain controller. This policy supports the TLS protocol for certificate-based authentication. The Mac computer is now configured for access to the radius access point.

On the Mac computer you can view the profile in System Preferences.

To configure Mac OS X 10.7 or later to create an 802.1X WiFi profile

1. On a Windows computer, open the Group Policy Management Editor and edit a group policy object that applies to Mac computers.
2. Expand **Computer Configuration > Policies > User Configuration > Policies > Centrify Settings > Mac OS X Settings > 802.1X Settings**, and double-click **Enable Wi-Fi Profile**.
3. Select **Enable**, then click **Add**.
4. Enter the following information for the Wi-Fi profile:

Select this	To do this
SSID	Type the SSID for the wireless network.
Template name	<p>Type the name of the auto-enrollment machine certificate that has been pushed down from the Windows domain server. When pushed to a Mac computer, certificate names are prepended with <code>auto_</code>; for example:</p> <p><code>auth_Centrify-1X</code></p> <p>This group policy runs a script that looks for the specified certificate template in the <code>/var/centrify/net/certs</code> directory (which contains the certificate templates pushed down from the domain controller) and creates an ethernet profile from this certificate.</p>
Security type	Select the Security type from the drop-down list.
Other options	<p>Select one or more of the following options:</p> <ul style="list-style-type: none"> ▪ Auto join: Select this option to specify that the

Select this	To do this
-------------	------------

computer automatically join a Wi-Fi network that it recognizes. Do not select this option to specify that the logged in user must manually join a Wi-Fi network.

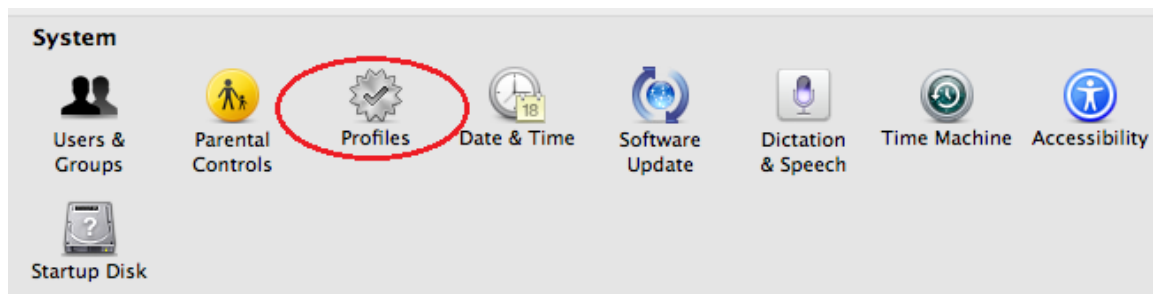

- **Hidden network:** Select this option if the Wi-Fi network does not broadcast its SSID.
-

5. Click **OK** to save the profile information and **OK** again to save the policy setting.

Note This group policy will take effect at the next group policy update interval, or you can run `adgpupdate` in a Terminal window on the Mac computer to have the policy take effect immediately.

When the group policy takes effect, it runs a script to create a WiFi profile for the computer from the certificate template and private key downloaded from the domain controller. This policy supports WEP or WPA/WPA2 security with the TLS protocol for certificate-based authentication. The Mac computer is now configured for access to the radius access point.

On the Mac computer you can view the profile in System Preferences.

Confirming that the Windows server (Certificate Authority) is set up properly to support auto-enrollment of certificates on Mac computers

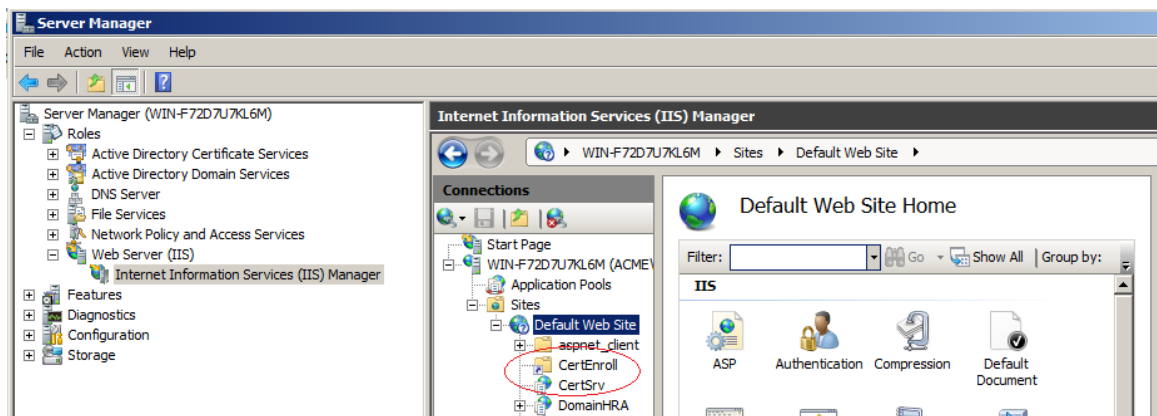

This section describes how the RADIUS server must be configured to support 802.1X wireless configuration for Mac computers.

Internet Information Services (IIS) supports CertEnroll and CertSrv URLs

IIS must support the CertEnroll and CertSrv URLs to enable web-based access to certificate tasks.

To verify that IIS supports the CertEnroll and CertSrv URLs

1. On the Windows Certificate Authority server, click **Start > Administrative Tools > Server Manager** to open Server Manager.
2. Expand **Roles > Web Server (IIS)** and click **Internet Information Services (IIS) Manager**.
3. In the right, **Connections** pane, expand **Sites > Default Web Site** and you should see CertEnroll and CertSrv:

Windows public key group policies are set to trust the root certificate authority and enroll certificates automatically

Through group policy settings, the root certificate must be imported into the Trusted Root Certification Authorities group policy and set to enroll certificates automatically.

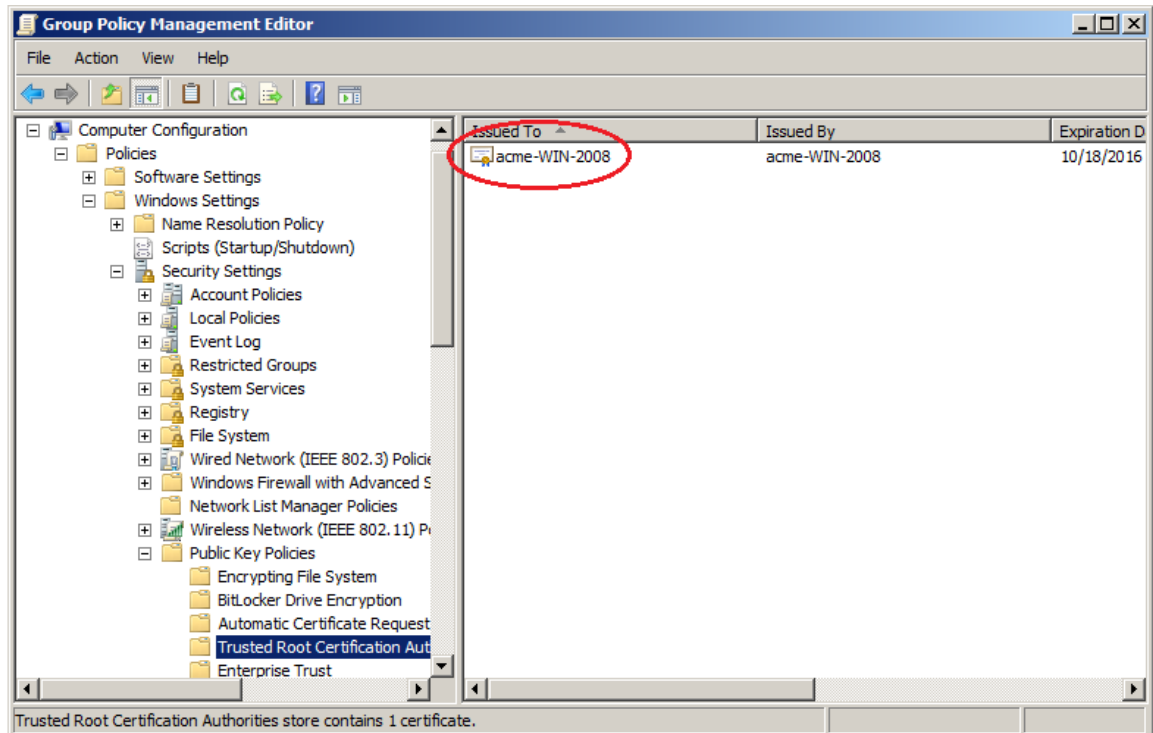

To verify that Windows public key group policies are set to trust the root certificate authority and enroll certificates automatically

1. On the Windows Certificate Authority server, click **Start > Administrative Tools > Server Manager** to open the Group Policy Management Editor.

• • • • •

2. Expand **Computer Configuration > Policies > Windows Settings > Security Settings > Public Key Policies** and select **Trusted Root Certification Authorities**.

You should see your root certificate:

3. Expand **Computer Configuration > Policies > Windows Settings > Security Settings > Public Key Policies** and double-click **Certificate Services Client - Auto-Enrollment**.
4. In **Configuration Model** select **Enabled**.
5. Select both boxes, **Renew expired certificates** and **Update certificates that use certificate templates**.
6. Click **OK** to save the policy.

A certificate template is configured to automatically enroll domain computers

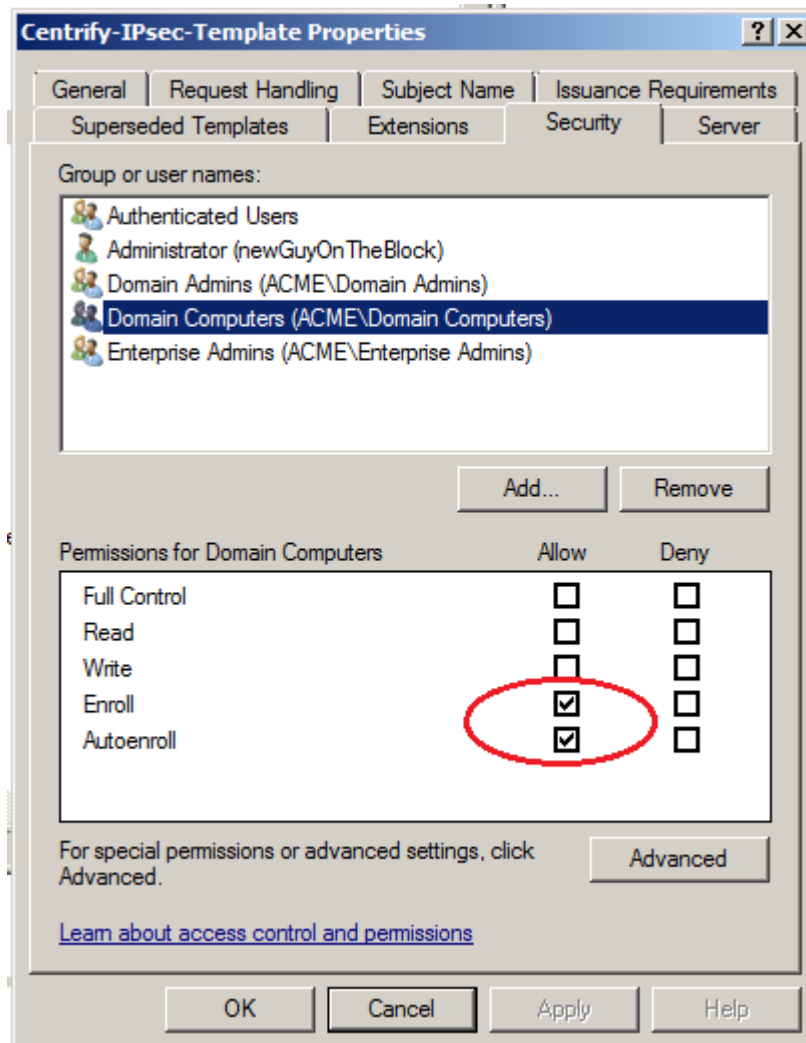

To automatically enroll domain computers, you must have a certificate template that supports auto-enrollment for domain computers.

To configure a certificate template to automatically enroll domain computers

1. On the Windows Certificate Authority server, open an mmc console that contains the Certification Authority and Certificates snap-ins (**Start > Run > mmc.exe**).
2. If snap-ins for Certificate Templates, Certificates, and Certifications Authority are not displayed under Console Root in the navigation pane, add them now. To do so, click **File > Add/Remove Snap-in**.
 - a. Select **Certificate Templates** and click **Add**.
 - b. Click **Certificates** and click **Add**.
 - c. Select **Computer Account** and click **Next**.
 - d. Select **Local computer** and click **Finish**.
 - e. Select **Certification Authority** and click **Add**.
 - f. Select **Local computer** and click **Finish**.
 - g. Click **OK**.
3. Select **Certificate Templates (domainController)** in the navigation pane.
4. In **Certificate Templates**, duplicate the Workstation Authentication certificate. Right-click **Workstation Authentication** and select **All Tasks > Duplicate Template**.
5. Perform the following steps in the **Properties of New Template** dialog:
 - a. In the **General** tab, type a template name of your choice (for example, **Mac Auto-Enroll Certificates**) in the **Template name** field (do not use special characters such as brackets and asterisks). Type the same name in the **Template display name** field so that the template displays by that name in the Certificate Templates list.
 - b. In the **Extensions** tab, select **Application Policies > Edit**. In the resulting dialog, select **Add > Server Authentication** and click **OK**.
 - c. In the **Extensions** tab, verify the **Client Authentication** is already in the application policy list. If it is not, add it in the same way that you added the **Server Authentication** policy.
 - d. In the **Subject Name** tab, select **Build from this Active Directory information**. In the **Subject name format** field, select **Fully distinguished name**. In the **Include this information in alternate subject name** list, select **User Principle Name (UPN)**.

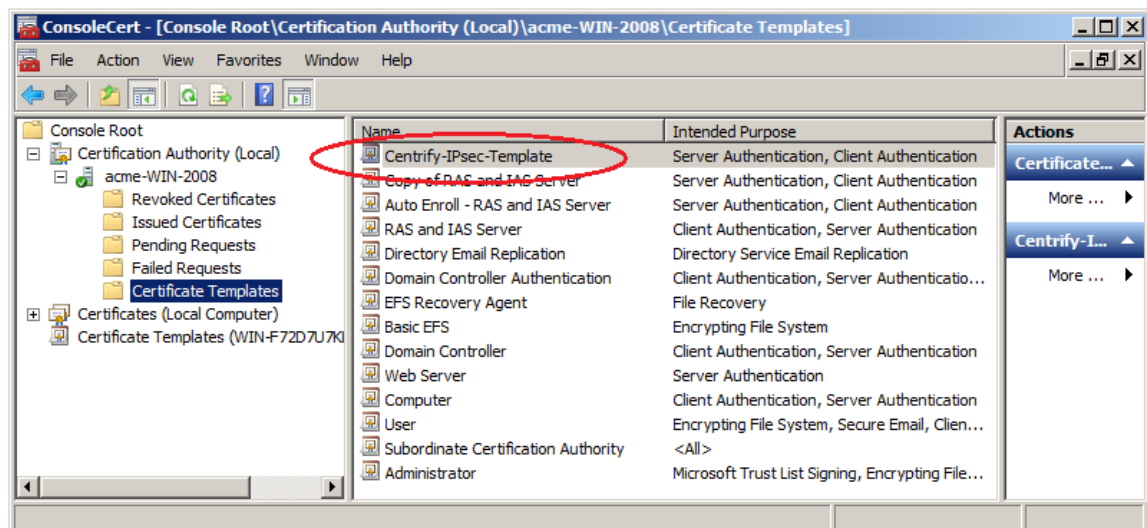

• • • • •

- e. In the **Security** tab, select **Domain Computers (domainController)** and ensure that the template is enabled for Enroll and Autoenroll.

- f. Click **Apply** and **OK** to save your settings.
6. Verify that the new template has been added to the certification authority.

Expand **Console Root > Certification Authority > domainController** and select **Certificate Templates**. You should see that the certificate template that you have configured for auto-enrollment is contained in the certification authority for the domain:

If the new certificate template is not contained in the certification authority, add it now:

- a. In the navigation pane, right-click **Certificate Templates** under **Console Root > Certification Authority > domainController**.
 - b. Select **New > Certificate Template to Issue**.
 - c. Scroll to the newly created template, select it, and click **OK**.
7. Enable the following group policy:
- On Windows 2008: **Computer configuration > Policies > Windows Settings > Security Settings > Public Key Policies > Certificate Services Client - Auto-Enrollment Settings**.
 - On Windows 2012: **Computer configuration > Policies > Windows Settings > Security Settings > Public Key Policies > Certificate Services Client - Auto-Enrollment**

Note To enable a group policy, open the Group Policy Management console by selecting **Start > Administrative Tools > Group Policy Management**. In the Group Policy Management console navigation pane, expand **Group Policy Management > ForestName > Domains > DomainName > Group Policy Objects**. Right-click **Default Domain Policy** and select **Edit**. In the resulting Group Policy Management Editor, navigate to the group policy described above and double-click the group policy. In the resulting dialog, select **Enabled** in the **Configuration Model** field.

• • • • •

8. On the Mac computer, download the certificates by executing the following commands in a terminal window:

```
sudo adflush
```

```
adgpupdate
```

9. Verify that the certificates were downloaded:
 - a. On the Mac computer, open Keychain Access and verify that the certificates are there.
 - b. On the Mac computer, verify that the certificates are in `/var/centrify/net/certs`.
 - c. On the Windows Certificate Authority server, open the Certification Authority console (**Start > Run > `certsrv.msc`**) and verify that the certificates are in the **Issued Certificates** folder.

A certificate template is configured to automatically enroll domain users

To automatically enroll domain users, you must have a certificate template that supports auto-enrollment for domain users.

To configure a certificate template to automatically enroll domain users

1. On the Windows Certificate Authority server, open an mmc console that contains the Certification Authority and Certificates snap-ins (**Start > Run > `mmc.exe`**).
2. Verify that the snap-ins described in Step 2 on page 86 are present under Console Root in the navigation pane. If they are not, add them now as described in Step 2 on page 86.
3. Select **Certificate Templates (domainController)** in the navigation pane.
4. In **Certificate Templates**, duplicate the User certificate. Right-click **User** and select **All Tasks > Duplicate Template**.
5. Perform the following steps in the **Properties of New Template** dialog:
 - a. In the **General** tab, type a template name in the **Template name** field. Type the same name in the **Template display name** field so

that the template displays by that name in the Certificate Templates list. For Mac, you can specify a name of your choice (do not use special characters such as brackets and asterisks). For mobile devices, the template name *must* be **User-ClientAuth**.

- b. In the **Security** tab, select **Domain Users (domainController)** and ensure that the template is enabled for Enroll and Autoenroll.
 - c. Optionally, in the **Subject Name** tab, select **Build from this Active Directory information**. De-select the **Include email in subject name** and **E-mail name** check boxes. If you perform this step, Active Directory users do not need an email address.
6. Verify that the new template has been added to the certification authority as described in Step 6 on page 87. If the new certificate template is not contained in the certification authority, add it now as described in Step 6 on page 87.
 7. Enable the following group policy:
 - On Windows 2008: **Computer configuration > Windows Settings > Security Settings > Public Key Policies > Certificate Services Client - Auto-Enrollment Settings**.
 - On Windows 2012: **Computer configuration > Windows Settings > Security Settings > Public Key Policies > Certificate Services Client - Auto-Enrollment**.

Note See Step 7 on page 88 for details about how to enable the group policy.

8. On the Mac computer, download the certificates by executing the following commands in a terminal window.

As the local Administrator:

```
sudo adflush
```

As an Active Directory user:

```
adgpupdate
```

9. Verify that the certificates were downloaded:
 - a. On the Mac computer, open Keychain Access and verify that the certificates are in the Login keychain.
 - b. On the Mac computer, verify that the certificates are in

.....

```
~/centrify/
ls -l ~/centrify/
```

Configuring single sign-on for SSH and Screen Sharing

On OS X 10.10 and later, you can change configuration settings to allow single sign-on for SSH and Screen Sharing using Kerberos. Kerberos authorization for SSH and Screen Sharing allows you to establish an SSH or Screen Sharing connection to configured target machines joined to the same domain within the same single sign-on (SSO) session. In addition to authorizing SSH or Screen Sharing for the currently logged in user, you can authorize SSH or Screen Sharing for a different smart card user (for example, an admin user) by obtaining that user's Kerberos credentials.

- To configure SSH SSO
- To configure Screen Sharing SSO
- Migrating a user from Apple's Active Directory plugin to Centrify Active Directory

To configure SSH SSO

Note Smart card authentication for SSH sessions across different forests or domains is not supported.

1. Verify that all client and target machines are joined to the same AD domain.
See [Joining an Active Directory domain](#) for more information.
2. Enable `GSSAPIAuthentication` and `GSSAPIDelegateCredentials` in the `/etc/ssh/ssh_config` (`/etc/ssh_config` on OS X 10.10) file on both the client and target machine.

```
GSSAPIAuthentication          yes
```

```
GSSAPIDelegateCredentials    yes
```

3. Enable `GSSAPIAuthentication` and `GSSAPIKeyExchange` in the `/etc/ssh/sshd_config` (`/etc/sshd_config` on OS X 10.10) file on both

• • • • •

the client and target machine.

```
GSSAPIAuthentication    yes
```

```
GSSAPIKeyExchange      yes
```

4. Enable `adclient.krb5.autoedit` on the target machine.

The easiest way to do this is enabling the **DirectControl Settings > Kerberos Settings > Manage Kerberos configuration** group policy.

5. Restart Centrify Management Services on the target machine.

```
$ sudo /usr/local/share/centrifydc/bin/centrifydc  
restart
```

The logged in user can now open SSH connections to the target machine using a FQDN.

```
$ ssh hostname.domainname
```

To configure Screen Sharing SSO

Note Single sign-on for Screen Sharing requires Mac OS X 10.11 or higher.

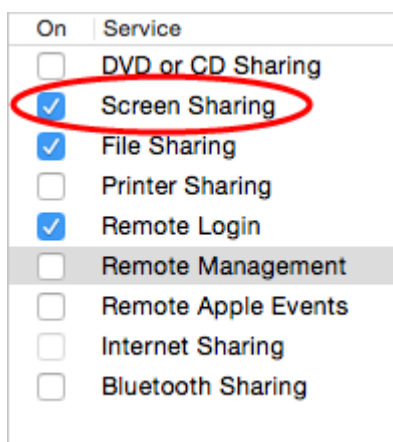

1. Verify that both the client and target machines are updated to at least Centrify Management Services 5.3.1.

```
$ adinfo -v
```

```
adinfo (CentrifyDC 5.3.1-xxx)
```

If an update is necessary, refer to [Upgrading the Centrify agent](#) for instructions and best practices.

2. Open **System Preferences > Sharing**, then select **Screen Sharing** and specify which users can initiate Screen Sharing sessions in the **Allow access for:** list.

Note Only Screen Sharing supports SSO, as Remote Management can not allow access for network users.

The logged in user can now open Screen Sharing connections to the target machine using a FQDN.

```
$ open vnc://hostname.domainname
```

To obtain Kerberos credentials for a smart card user for SSH or Screen Sharing SSO

1. Complete all of the steps in [Configuring single sign-on for SSH and Screen Sharing](#) and [Configuring single sign-on for SSH and Screen Sharing](#).
2. Insert the user's smart card into the reader.
3. Obtain Kerberos credentials from the smart card currently in the reader and use those credentials to authorize SSH.

For multi-user PIV cards or multi-user smart cards:

```
$ /usr/local/bin/sctool -a unixName
```

For all other smart cards:

```
$ /usr/local/bin/sctool -k userPrincipalName
```

Refer to [Understanding sctool](#) for more information about the `sctool -a` and `-k` options.

After unlocking the smart card, you can now open SSH or Screen Sharing connections to the target machine using the obtained Kerberos credentials.

Configuring FileVault 2

FileVault 2, available in OS X 10.8 and later, allows encryption of an entire drive to keep data secure. Although you can enable FileVault 2 through System Preferences on your Mac computers, using Centrify Management Services for Mac to configure FileVault 2 through group policy provides the advantage of creating an institutional recovery key for each of your Mac computers. Two different recovery key approaches—institutional and personal—guarantee that you will always have access to all of your encrypted computers, even if users forget their passwords.

For more information about FileVault 2, see the following Apple Knowledge Base article: [“OS X: About FileVault 2”](#).

How FileVault2 protection is enabled by Centrify

Centrify relies on two features to enable FileVault 2 protection:

- The "Managed By" user setting, which specifies an Active Directory user who can manage and unlock an encrypted disk.

You specify the "Managed By" user in Active Directory Users and Computers on the domain controller. The "Managed By" user is associated with the Mac computer object, so it is possible for each computer to have its own "Managed By" user.

- The FileVault recovery key, which can be either one "institutional" key that is applied to multiple Mac computers, or computer-specific keys which are generated individually for each Mac computer.

- If you choose to use one institutional key, you first create a FileVaultMaster certificate, which is applied to Mac computers through the Enable FileVault 2 group policy.

When you enable the Enable FileVault 2 group policy, the FileVaultMaster certificate is applied to Mac computers automatically at the next scheduled group policy update interval. Or, you can apply the FileVaultMaster certificate immediately by executing the `adgpupdate` command.

- If you choose to use computer-specific keys that are unique to each Mac computer, you do not create a FileVaultMaster certificate.

Instead, the key is generated automatically when the “Managed By” user logs into the Mac computer for the first time and then logs out. The key, which is the “Managed By” user’s personal key, is then stored in the computer’s computer object in Active Directory.

Note Enabling the Enable FileVault 2 group policy does not enable FileVault 2 protection on the Mac computers to which the group policy is applied. Instead, FileVault 2 protection is enabled on Mac computers as described in the remainder of this section.

The following list describes the overall process that results in FileVault 2 protection being enabled on a Mac computer.

1. The “Managed By” user is set in ADUC for one or more Mac computers.
2. The Enable FileVault 2 group policy is enabled.
 - If you select the **Use Institutional Recovery Key** option in the group policy, the FileVaultMaster certificate is applied to Mac computers. In this situation, all of the Mac computers to which the group policy was applied use the same key.
 - If you did not select the **Use Institutional Recovery Key** option in the group policy, a recovery key is not generated until the “Managed By” user logs into a Mac computer.
3. A user logs into a Mac computer. If FileVault 2 protection is not already enabled on the computer, the user’s Active Directory credentials are checked to verify that the user is the “Managed By” user. For this step to complete successfully, one of the following conditions must exist:
 - The Mac computer must be able to communicate with the domain controller (that is, it must be in connected mode), or
 - If the Mac computer is disconnected from the domain controller, locally cached AD user credentials must be available in the Centrify cache.
4. When the user is verified to be the “Managed By” user, one of the following actions takes place:
 - If you selected the **Use Institutional Recovery Key** option in the Enable FileVault 2 group policy, the FileVaultMaster certificate data is used to enable FileVault 2 protection on the computer.
 - If you did not select the **Use Institutional Recovery Key** option in

the Enable FileVault 2 group policy, a personal recovery key is created for the computer and stored in the computer object in Active Directory. The personal recovery key is used to enable FileVault2 protection on the computer.

FileVault 2 Configuration Overview

Configuring a Mac computer for FileVault 2 protection requires configuration steps on both the Mac computer and the domain controller (or any Windows computer on which you can configure Group Policy on the domain controller). The following is a list of the major steps in the process, with links to each procedure that you must complete.

1. [Create FileVault master keychain](#). The master keychain contains a private key that can be used to unlock the encrypted disk.

Note This step is required only if you are using one institutional key for multiple Mac computers. If you are using computer-specific (“personal”) keys, go to Step 4.

2. [Export certificate from FileVault master keychain and upload it to a domain server](#). Uploading the certificate to a domain server allows you to select it when you enable the “FileVault 2” group policy.

Note This step is required only if you are using one institutional key for multiple Mac computers. If you are using computer-specific (“personal”) keys, go to Step 4.

3. [Enable BitLocker Recovery Password Viewer in Active Directory](#).

This step is required only if you are using computer-specific (“personal”) keys. If you are using one institutional key for multiple Mac computers, go to Step 4.

4. [Assign an Active Directory user who is authorized to manage an encrypted disk](#). FileVault 2 requires that you specify one or more “Managed By” users who can manage the encrypted disk, including the ability to lock and unlock it.

5. [Enable the Enable FileVault 2 group policy](#). Enabling the “FileVault 2” group policy applies the FileVaultMaster certificate to Mac computers.

6. [Set up and verify FileVault 2 protection](#). After FileVault 2 protection is

enabled, the disk encryption process begins after the FileVault-authorized user logs off the computer.

Before you begin configuring FileVault 2

Be aware of the following requirements and limitations when configuring FileVault 2 through Centrify group policy:

- The Mac computer must be running OS X 10.9 or above.
- The Mac computer must have a recovery partition — generally, this partition is created by default during Mac OS X or macOS installation.
- FileVault 2 must *not* be enabled on the Mac computer (through the Security & Privacy System Preference).

If it is already configured, configuring FileVault 2 through Centrify Management Services for Mac will have no effect.

- Enabling FileVault 2 protection disables auto log on for the Mac computer.
- FileVault 2 protection does not support smart card authentication at start up of the computer.

The Apple technical white paper, "[Best Practices for Deploying FileVault2](#)" provides more information about using FileVault 2; specifically, the section "Two Factor Authentication" discusses the limitations of using FileVault 2 with alternate authentication methods such as smart cards.

Create FileVault master keychain

The procedure described in this section is required only if you are using one institutional key for multiple Mac computers. If you are using computer-specific ("personal") keys, go to [Assign an Active Directory user who is authorized to manage an encrypted disk](#).

On the Mac computer, you create a FileVault master keychain, which contains a private key that can be used to unlock the encrypted drive on the computer.

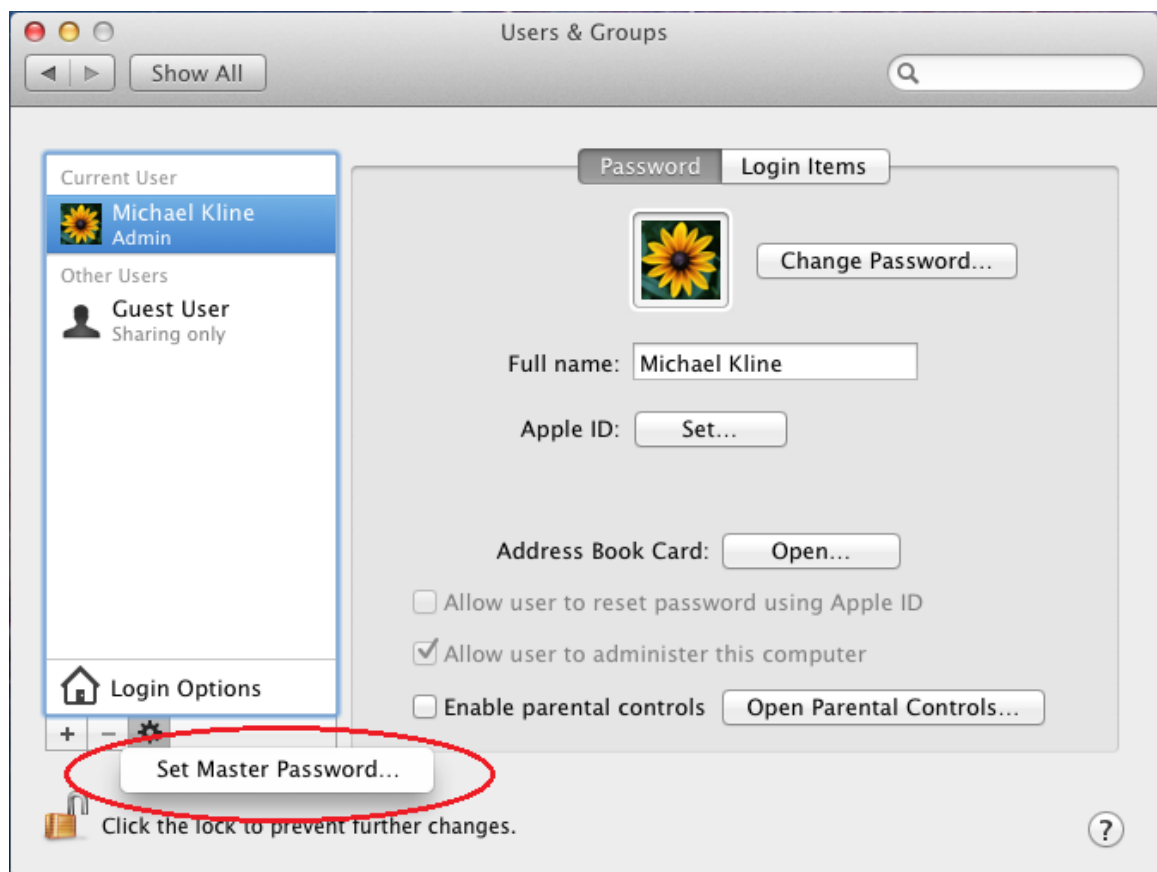

You can create the master keychain through the Mac user interface, or by executing commands in the Terminal application. Instructions are provided for each procedure.

.....

Note If the computer already has a FileVault master keychain, you can skip this procedure and go to [Export certificate from FileVault master keychain and upload it to a domain server](#).

To create a master keychain through the user interface

1. On a computer running OS X 10.9 or above, log on with an administrator's account and open **System Preferences**, then double-click **Users & Groups**.
2. If necessary, click the lock icon and enter credentials to authenticate.
3. Select an administrator's account, then click the service icon (⚙️) and select **Set Master Password** from the pop-up menu.

4. Create a master password by typing it in **Master password** and re-typing in **Verify**.
5. Click **OK** to save the master password.

Setting a master password creates a keychain file in the following location:

`/Library/Keychains/FileVaultMaster.keychain`

This file contains the private key required to unlock the encrypted disc and is the only recovery method you will have for encrypted disc recovery. Store `FileVaultMaster.keychain` in a safe location, such as an external drive or an encrypted disk image on another physical disk.

To create a master keychain by executing commands in the Terminal application

1. On a Mac computer, open the Terminal application.

2. Run the following command:

```
sudo security create-filevaultmaster-keychain
```

3. Enter the password for the root account when prompted as follows:

```
To proceed, enter your password or type Ctrl-C to abort
```

4. Enter the master password to create when prompted to do so:

```
password for new keychain
```

5. Retype the new master password when prompted to do so:

```
retype password for new keychain
```

You will see a message that the new password is being created:

```
Generating a 2048 bit key pair; ...
```

Setting a master password creates a keychain file in the following location:

```
/Library/Keychains/FileVaultMaster.keychain
```

This file contains the private key required to unlock the encrypted disc and is the only recovery method you will have for encrypted disc recovery. Store `FileVaultMaster.keychain` in a safe location, such as an external drive or an encrypted disk image on another physical disk.

Export certificate from FileVault master keychain and upload it to a domain server

The procedure described in this section is required only if you are using one institutional key for multiple Mac computers. If you are using computer-

specific (“personal”) keys, go to [Assign an Active Directory user who is authorized to manage an encrypted disk](#).

After you create a master password, as explained in the previous section, you must export the certificate associated with the master keychain to make it available for upload to the domain controller.

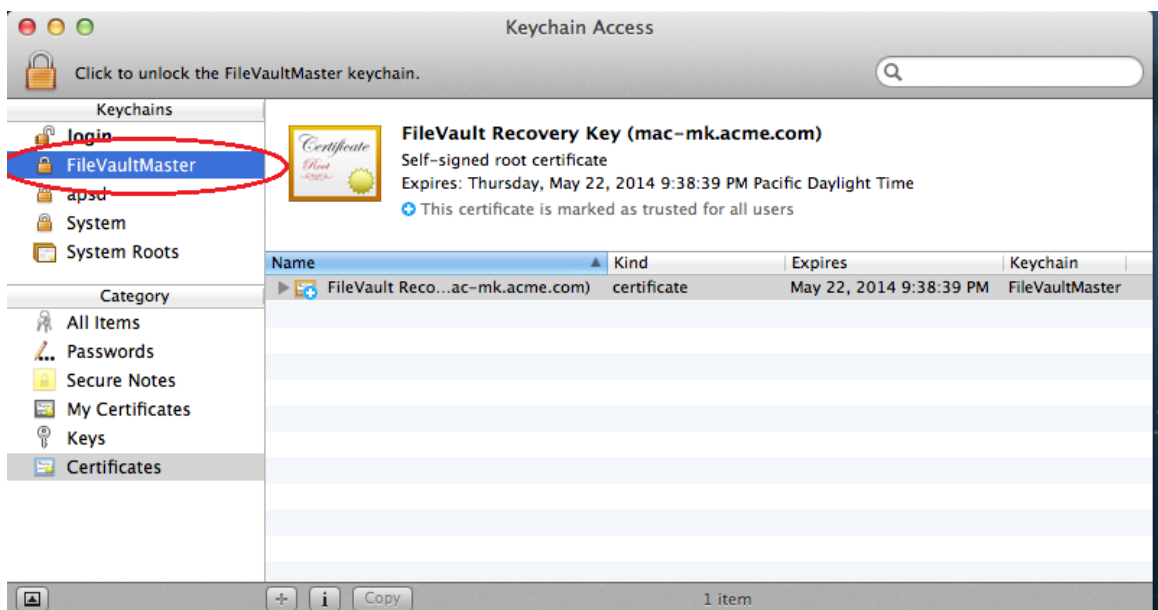

You can export the certificate by using the Mac user interface, or by executing commands in the Terminal application. Instructions are provided for each procedure.

To export the certificate by using the Keychain Access utility

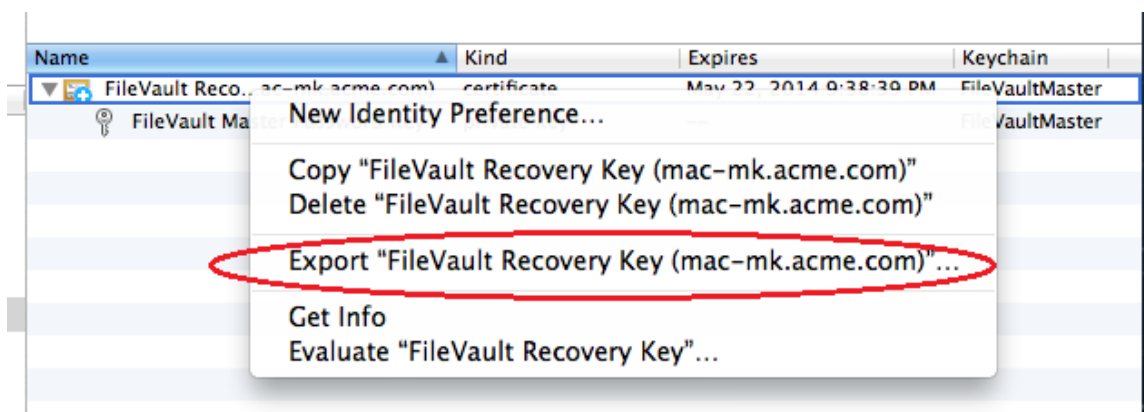

1. On the Mac computer, open the Keychain Access utility, or double-click the `FileVaultMaster.keychain` file, which is at the following location:

`/Library/Keychains/FileVaultMaster.keychain`

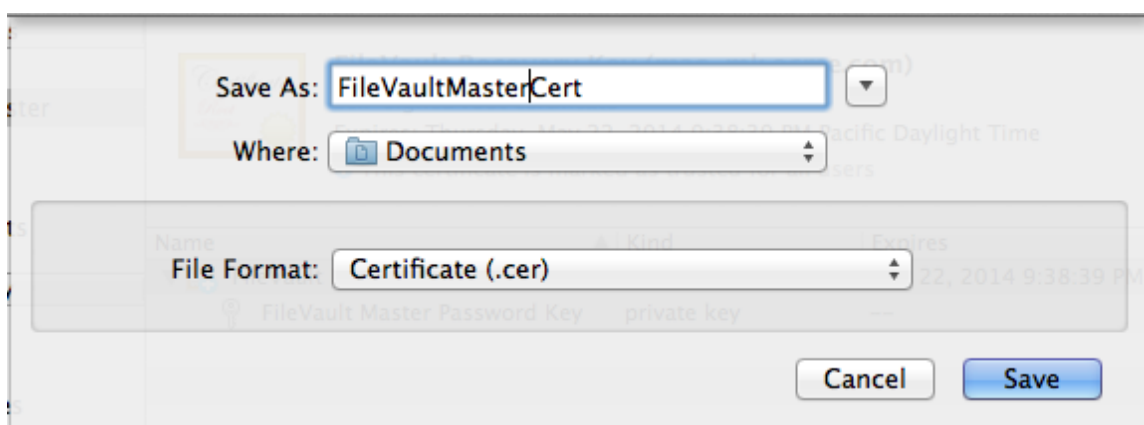

2. Enter you password if prompted to do so.
3. In **Keychains**, select **FileVaultMaster**.

4. Select the certificate, **FileVault Recovery Key** in the right pane and expand it; then right-click and select **Export “FileVault Recovery Key”**.

5. Enter the following information for saving the certificate:

- **Save As:** Type a name for the certificate, such as "FileVaultMasterCert".
- **Where:** Navigate to a folder in which to save the certificate.
- **File Format:** Select **Certificate (.cer)** from the scroll-down list.

The certificate is now available for upload to a domain controller.

6. Copy the certificate to a location on a server that is accessible from the computer that you use to configure Group Policy for the domain.

Later, when you enable the group policy to turn on FileVault 2 protection (see [Enable the Enable FileVault 2 group policy](#)), you must be able to access this certificate from the domain controller on which you are running the Group Policy Editor.

To export the certificate by using Terminal commands

1. On the Mac computer, open the Terminal utility application.
2. Run the following command:

```
sudo security export -k /PathToKeychain -t certs -f
x509 -o /PathToCert
```

Note The `sudo` command is required only if `FileVaultMaster.keychain` is owned by root.

where:

- *PathToKeychain* is the path to `FileVaultMaster.keychain`; for example:

```
/Library/Keychains/FileVaultMaster.keychain
```

- *PathToCert* is the path to the location in which to export the certificate; for example:

```
/Documents/FileVaultMaster.cer
```

The certificate is now available for upload to a domain controller.

3. Copy the certificate to a location on a server that is accessible from the computer that you are using to configure Group Policy for the domain.

Later, when you enable the group policy to turn on FileVault 2 protection (see [Enable the Enable FileVault 2 group policy](#)), you must be able to access this certificate from the domain controller on which you are running the Group Policy Editor.

Enable BitLocker Recovery Password Viewer in Active Directory

The procedure described in this section is required only if you are using computer-specific (“personal”) keys. If you are using one institutional key for multiple Mac computers, go to [Assign an Active Directory user who is authorized to manage an encrypted disk](#).

To enable the BitLocker Recovery Password Viewer feature in Active Directory

1. On the domain controller, open **Administrative Tools > Server Manager**.

2. In the navigation pane, right-click **Features** and select **Add Features**.
3. In the Add Features wizard, expand **Remote Server Administration Tools > Feature Administration Tools**, select **BitLocker Drive Encryption Administration Utilities**, click **Next**, and click **Install**.
4. After the BitLocker Drive Encryption Administration Utilities are installed, click **Close**.
5. To verify that the BitLocker Drive Encryption Administration Utilities are installed:
 - a. Open Active Directory Users and Computers.
 - b. Navigate to **domaincontroller > Domain Controllers**.
 - c. In the right-hand ADUC pane, right-click the domain controller and select **Properties**.
 - d. If the BitLocker Drive Encryption Administration Utilities installed correctly, the Properties dialog contains a **Bitlocker Recovery** tab. On that tab, a “No items in this view” message displays. That message is normal, and does not indicate a problem with the BitLocker Drive Encryption Administration Utilities installation.

Assign an Active Directory user who is authorized to manage an encrypted disk

Before enabling FileVault 2, you must assign a user account that is able to open the disk for the Mac computer after it is encrypted by FileVault 2. This setting specifies the “Managed By” user for a computer.

Note Enabling the “FileVault2” group policy, as explained in the next section, encrypts the entire disk for the computer. The user account that you assign in the current procedure will be authorized to access the disk during boot up so that this account will be able to log on. You can later add other accounts, but for now, this is the only account that will be able to log on to this computer.

The “Managed By” user account must be an Active Directory mobile user account. See [Configuring a portable home directory](#) for information about the steps you must take to create a mobile user account.

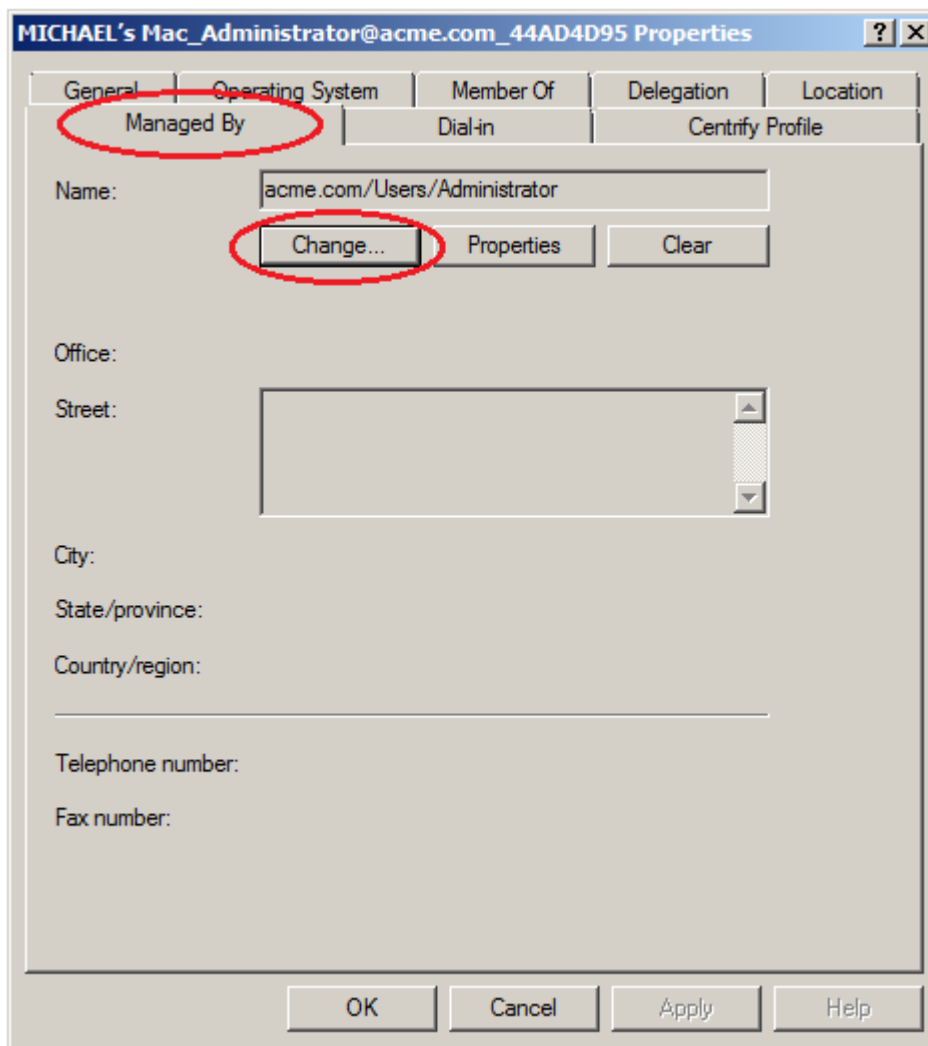

Note After you enable a user account to open an encrypted disk at start up, you cannot remove that account from the list. If you no longer want this user account to be able to unlock the disk, you can delete the account from Active Directory. Before doing so, be certain that you have at least one other account that can unlock the hard disk on this computer, otherwise you will no longer be able to access this computer.

To assign an account that can unlock the encrypted disk

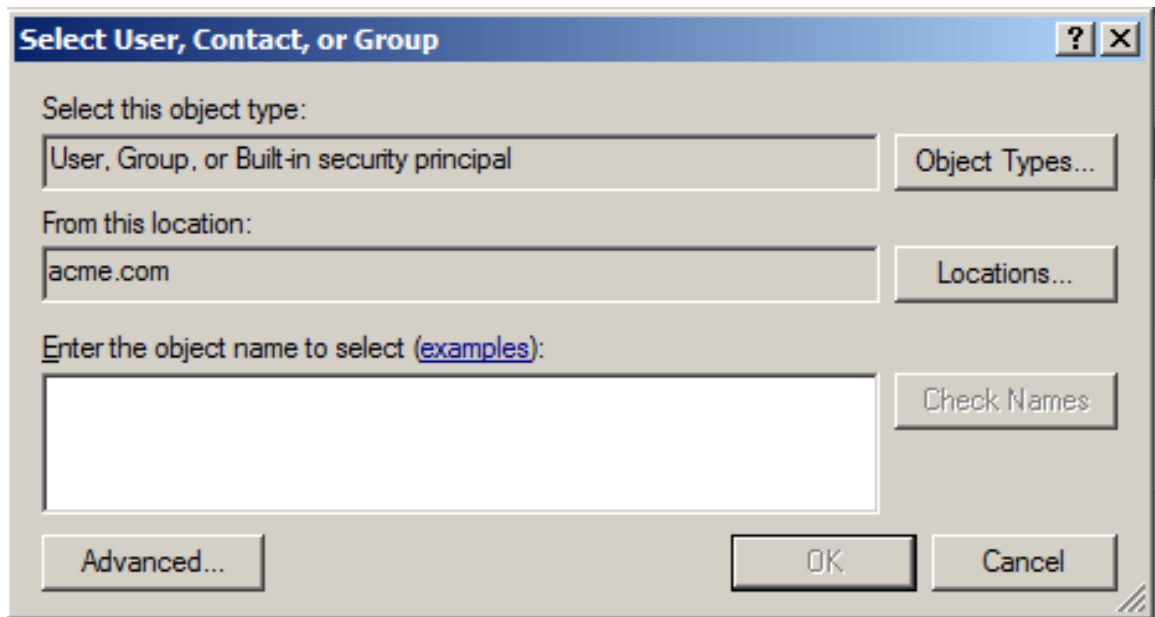

1. On a domain controller, open Active Directory Users and Computers
2. Expand the domain object and navigate to the container that contains the Mac computer, for example, **Computers**.
3. Select the Mac computer that you plan to encrypt, right-click and select **Properties**.

• • • • •

4. Click the **Managed By** tab.

5. Click **Change**.
6. Enter the all or part of the name to search for (make certain that **User** is selected in **Object Type**) and click Check Names.

7. If the name is correct, click **OK** then **OK** again to save your changes.

Enable the Enable FileVault 2 group policy

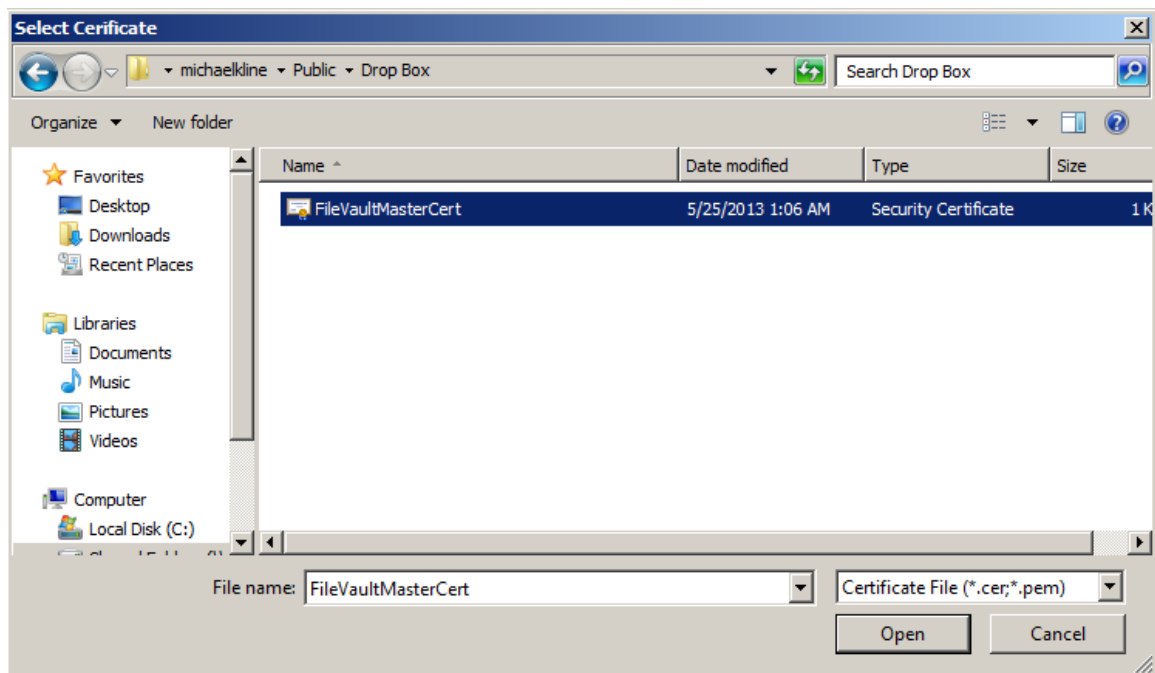

Next, enable the “Enable FileVault 2” group policy to encrypt the disk. When you enable this group policy, you select whether to use one institutional key for multiple Mac computers, or computer-specific (“personal”) keys.

To enable the Enable FileVault 2 group policy

1. On a Windows computer, open the Group Policy Management Editor.
2. Select a Group Policy Object that applies to the Mac computer you are planning to encrypt, then right-click and select **Edit**.
3. Open **Computer Configuration > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy**, then double-click **Enable FileVault 2**.
4. Click **Enable**.
5. Specify whether to use one institutional key for multiple Mac computers, or computer-specific (“personal”) keys:
 - To use one institutional key for multiple Mac computers, select **Use Institutional Recovery Key**. Then click **Select** to select the FileVault keychain certificate that you created earlier as described in [Create](#)

[FileVault master keychain](#). If you select this option, the FileVaultMaster certificate is distributed to all of the Mac computers to which the group policy applies. Go to [Enable the Enable FileVault 2 group policy](#) and continue from there.

- To use computer-specific (“personal”) keys, leave **Use Institutional Recovery Key** unchecked. In this situation, a personal recovery key is created for the Mac computer and stored in the computer object in Active Directory. The key is created and sent to the computer object in Active Directory after the “Managed By” user reboots the Mac computer (or restarts the agent), logs in, logs out, and provides the user password as described in [Set up and verify FileVault 2 protection](#) and [Set up and verify FileVault 2 protection](#). The personal recovery key is used to enable FileVault2 protection on the Mac computer. Go to Step 8 and continue from there.
6. In the Explorer dialogue, navigate to the folder in which you uploaded the certificate.
 7. Select the certificate and click **Open**.

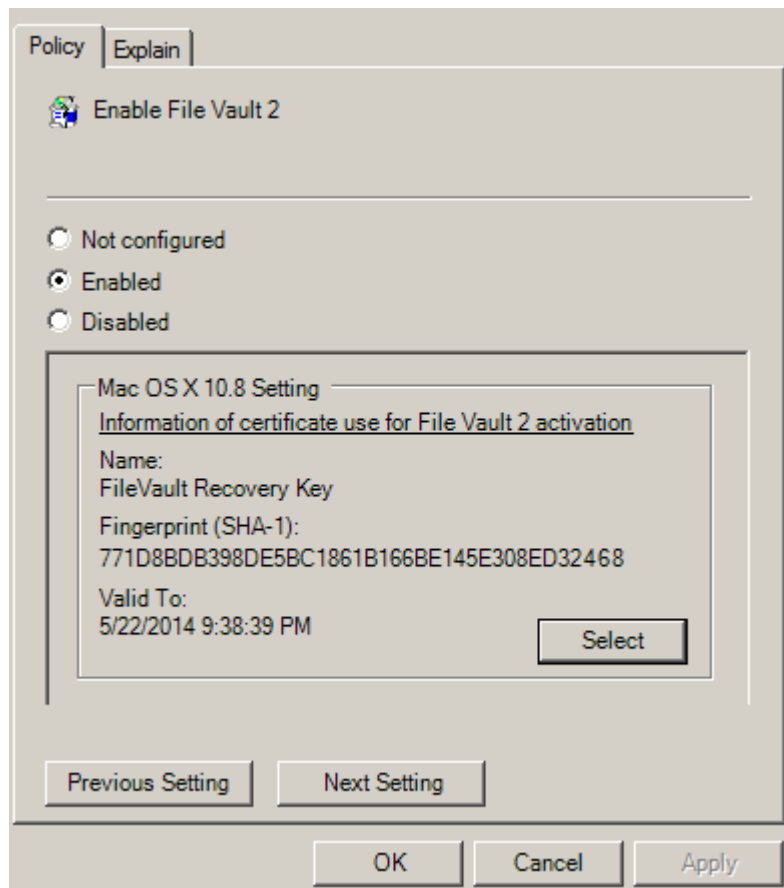

8. Click **OK** to enable the group policy.

This group policy will automatically take effect at the next group policy update interval. To have it take effect immediately, run the following command in the Terminal application on the Mac computer:

```
adgputdate
```

If you selected **Use Institutional Recovery Key** in Step 5, the FileVaultMaster certificate name, a thumbnail, and the expiration date are displayed in the Group Policy.

Note The expiration date is not important because OS X does no revocation checking on this certificate.

The selected certificate should have the following usages: “Digital Signature”, “Key Encipherment”, “Data Encipherment” and “Key Certificate Sign”. If the certificate does not have these usages, an error message will appear:

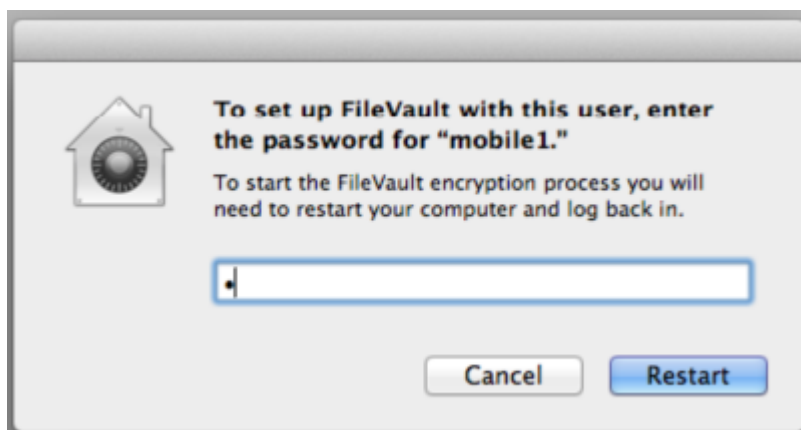

Set up and verify FileVault 2 protection

FileVault 2 protects a Mac computer by encrypting the entire hard drive when a FileVault-authorized user (the “Managed By” user) logs out. To set up FileVault 2 for the first time, you must log on to the Mac computer as the “Managed By” user, then log out, as explained in the following procedure. After FileVault 2 is set up, only a FileVault 2-authorized user may start up the Mac computer. You may add more authorized users if you wish, or maintain a single account.

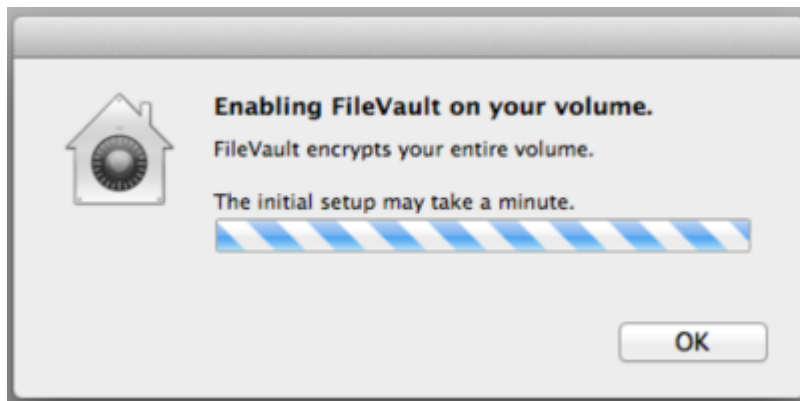

Note Although starting up the Mac computer requires a user account that is authorized to decrypt the start up disk, after the computer has started, this user account may log out to allow other user accounts to log in.

To set up FileVault 2 protection

1. Log on to the Mac computer with the “Managed By” account that you specified in [Assign an Active Directory user who is authorized to manage an encrypted disk](#).
2. Log the “Managed By” user out of the Mac computer, and when prompted, enter the user’s password to set up FileVault 2 protection.

The system displays a message that it is enabling FileVault protection, and when finished, restarts the computer.

3. Log back on to the Mac computer with the “Managed By” account.
The log on screen will show the FileVault 2-authorized user alone, because this is the only user authorized to open the start up disk.
4. Open **System Preferences**, click **Security & Privacy** and click the **FileVault** tab to verify details about FileVault protection.
5. Log out the FileVault-authorized user.

The log on screen now shows all users who are authorized for the computer.

A FileVault-authorized user is always required to start up the computer because the start up disk is encrypted. However, after the computer is running, any authorized user can log on to the computer. At this point, you have specified a single authorized account. To add more FileVault-authorized users, see [Adding FileVault-authorized users](#).

Confirming FileVault 2 protection on multiple computers

An administrator can verify the FileVault 2 status of multiple Mac computers that are enrolled in the Centrify identify platform.

Note Centrify Management Services for Mac allows you to both join a computer to a domain and enroll the same computer in the Centrify identify platform. To enroll a computer in the Centrify identify platform that is already joined to a domain — to take advantage of FileVault 2 reporting or for any other reason — see [Managing a Mac that is joined and enrolled](#)

After you have enrolled one or more Mac computers in the identify platform, you can verify their FileVault 2 status by logging into the Cloud Manager

.....

administrator's web portal. A user can see the FileVault 2 status of his or her computer by logging into the [Centrify user portal](#).

To verify the FileVault 2 status of computers enrolled in the identify platform:

1. Log in to [Cloud Manager](#).
2. Click the **Devices** tab to see a list of enrolled devices.
3. Click the name of any particular computer to see its FileVault 2 status:

Device Details

Device Information	
Device Name	Michael's Mac mini
File Vault 2	Enabled
Serial	C07G24TTDJ00
Storage	131.88 GB / 278.6 GB
System Model	Mac mini

Note For OS X versions 10.8 and lower, Cloud Manager shows the FileVault 2 status as 'Unknown'.

Cloud Manager displays FileVault 2 status when the device is enrolled and updates the status at the regular device polling interval (24 hours by default). Turning on FileVault 2 (encryption) and turning it off (decryption) requires rebooting the computer to take effect. Therefore, the FileVault 2 status depends on the setting (on or off), and whether the computer has been restarted. For example, if FileVault 2 encryption is on, but the computer has not been restarted, Cloud Manager will show FileVault 2 status as 'Disabled'. Once the computer has been restarted, even if encryption is still in progress, status will show as 'Enabled'. Likewise for decryption; if FileVault 2 encryption is turned off, the status will show as 'Enabled' until the computer is restarted.

Adding FileVault-authorized users

You can assign only one user as the "Managed By" user for the computer in Active Directory. If you want to authorize additional users to manage FileVault 2 protection, you must do so on the Mac computer by performing either one of the following procedures.

To authorize FileVault 2 users by using System Preferences

1. On the Mac computer, open **System Preferences > Security & Privacy**.
2. Click the **FileVault** tab, and if necessary, unlock the padlock.
3. Click the **Enable Users** button and an account list pops up.
4. Click **Enable Users** to add and enter password of that user.

To authorize FileVault 2 users by using Terminal commands

1. On the Mac computer, open the Terminal application.
2. Run the following command:

```
sudo fdesetup add -usertoadd user1
```

If prompted, enter the sudo password.
3. When prompted, enter the primary FileVault-authorized user name — this is the user who you specified to manage FileVault 2 (in [Assign an Active Directory user who is authorized to manage an encrypted disk](#)).
4. When prompted, enter the password for the primary FileVault-authorized user.
5. When prompted, enter the password for the new user who you specified on the command line (user1 in this example).

Changing FileVault 2 settings

After you enable FileVault 2, the settings that you are most likely to change at a later time are the “Managed By” user and the FileVaultMaster certificate.

To change the “Managed By” user on a Mac computer

1. Disable FileVault 2 manually on the Mac computer as described in [Disabling FileVault 2 protection](#).
2. On the domain controller, change the “Managed By” user as described in [Assign an Active Directory user who is authorized to manage an encrypted disk](#).

3. Ensure that the Mac computer can communicate with the domain controller (that is, it is in connected mode) so that it can fetch the new “Managed By” user information from Active Directory.

After you complete these steps, FileVault 2 protection is enabled on the Mac computer the next time the new “Managed By” user logs into the Mac computer.

To change the FileVaultMaster certificate

Note The procedure described in this section is supported only if you are using one institutional key for multiple Mac computers (that is, if you selected **Use Institutional Recovery Key** in [Enable the Enable FileVault 2 group policy](#)).

1. Disable FileVault 2 manually on each Mac computer that will use the new FileVaultMaster certificate. In most situations, this includes all computers to which the Enable FileVault 2 group policy is applied.
2. Specify a new FileVaultMaster certificate in the Enable FileVault 2 group policy as described in [Enable the Enable FileVault 2 group policy](#).
3. Execute the `adgupdate` command to have the Enable FileVault 2 group policy implement the new FileVaultMaster certificate on the Mac computers.

If you do not execute `adgupdate`, the old FileVaultMaster certificate is used until the next scheduled group policy update interval.

After you complete these steps:

- All of the Mac computers on which you disabled FileVault 2 (in Step 1) will use the new FileVaultMaster certificate the next time the “Managed By” user logs in.
- FileVault 2 protection is enabled on a Mac computer the next time the “Managed By” user logs into that Mac computer.

Disabling FileVault 2 protection

The only way to disable FileVault 2 protection is manually on the Mac computer. You cannot disable it by disabling the Enable FileVault 2 group policy.

You can disable FileVault 2 protection through the Security & Privacy System Preference, or by issuing commands in the Terminal application — view one or the other of the two sets of instructions that follow.

To disable FileVault 2 protection by using Security & Privacy preferences

1. On the Mac computer, open **System Preferences > Security & Privacy** and click the FileVault tab.
2. Click the padlock and enter authentication information to unlock System Preferences.
3. Click **Turn Off FileVault**.
4. Click the padlock to secure the changes.
5. Restart the Mac computer.

The disk is no longer encrypted and all authorized users, not just FileVault-authorized users, should be visible on the log on screen.

To disable FileVault 2 protection by issuing Terminal commands

1. On the Mac computer, open the Terminal application.
2. Enter the following command:

```
sudo fdesetup disable
```
3. Enter the root password when prompted.
4. Enter the password for the user account that is authorized to lock or unlock the disk.

This is the password for the user who you assigned in Active Directory to manage the Mac OS X computer.

5. Restart the Mac computer.

The disk is no longer encrypted and all authorized users, not just FileVault-authorized users, should be visible on the log on screen.

What happens if the FileVault-authorized user's password is reset?

If the password is reset while the computer is off or not connected to the domain, the password will not be immediately updated so the user must first log in with the old password, then back in with the new password.

For example, follow these steps for a sample set up such as the following:

- The Mac computer is turned off.
 - FileVault 2 is enabled.
 - user1 is the primary FileVault 2 authorized user.
1. An administrator changes the user1 password in Active Directory Users and Computers (through Reset Password), and informs user1 of the change.
 2. You start up the computer, log on as user1, and enter the new password, which fails.
 3. Enter the old password, which works.
 4. Restart the computer, log on and enter the new password, which should be successful.

Restoring the FileVault user list after adflush

In Centrify Infrastructure Services, if your FileVault 2 user list contains mobile users from another forest with one-way trust (that is, cross-forest mobile users), it is possible that those users will be removed from the FileVault 2 user list after you execute `adflush` or `adflush -f`.

After you upgrade to release 2015.1 or later, perform the following steps to ensure that cross-forest mobile users are added to the FileVault 2 user list permanently:

1. Execute the following command:

```
adflush -f
```

Executing this command removes the 2015-format, temporary GUID from cross-forest mobile users.

2. Execute the following command for each cross-forest mobile user that

you want to add permanently to the FileVault 2 user list:

```
adquery user -guid cross-forest-mobile-user-name
```

Executing this command assigns a new, permanent GUID to each user that you specify.

3. Execute the following command for each cross-forest mobile user that you want to add to the FileVault 2 user list:

```
fdsetup add -usertoadd cross-forest-mobile-user-name
```

Executing this command adds the specified user to the FileVault 2 user list.

4. Execute the following command to verify that the users are added to the FileVault 2 user list:

```
fdsetup list
```

How to recover an encrypted disk

If a user forgets the password for their encrypted disk, you can unlock the disk for them using the institutional recovery key that you created. See the following two Web articles for information:

- Apple Support: [“OS X: How to create and deploy a recovery key for FileVault 2”](#).

Note that you have already created the recovery key — you only need to read the information in the “Recovery” section.

- [“Unlock or decrypt your FileVault 2-encrypted boot drive from the command line”](#)

Deploy configuration profiles to multiple computers

This section explains how to deploy mobile configuration profiles to multiple computers by using a group policy setting (Install mobileconfig Profiles).

Note You can create mobile configuration profiles in a number of ways, for example by using the iPhone Config utility or OS X Server Profile Manager. This document assumes that you have already created a profile that you want to deploy, but does not show you how to do so.

You can deploy either computer or user profiles. For computer profiles, this feature requires OS X 10.7 or higher. For user profiles, this feature requires OS X 10.9 and higher.

The process for deploying a mobile configuration profile is as follows:

1. Create the mobile configuration profile.
2. Create a subdirectory in SYSVOL on the domain controller and copy the mobile configuration profile file to this directory. SYSVOL is a well-known shared directory on the domain controller that stores server copies of public files that must be shared throughout the domain.
3. Enable the “Install mobileconfig Profiles” group policy and specify the name of the file that you copied to SYSVOL.
4. The mapper script for the group policy runs on each Mac computer controlled by the GPO (when a user logs in or runs `adupdate`), downloads the profiles from the Active Directory server, and installs them in the Profiles system preference.

To create a subdirectory in SYSVOL:

1. Log in to the domain controller.
2. Change to the SYSVOL directory.
For example, go to this directory:

```
C:\Windows\SYSVOL\domain
```

3. Create a new folder named `mobileconfig`.

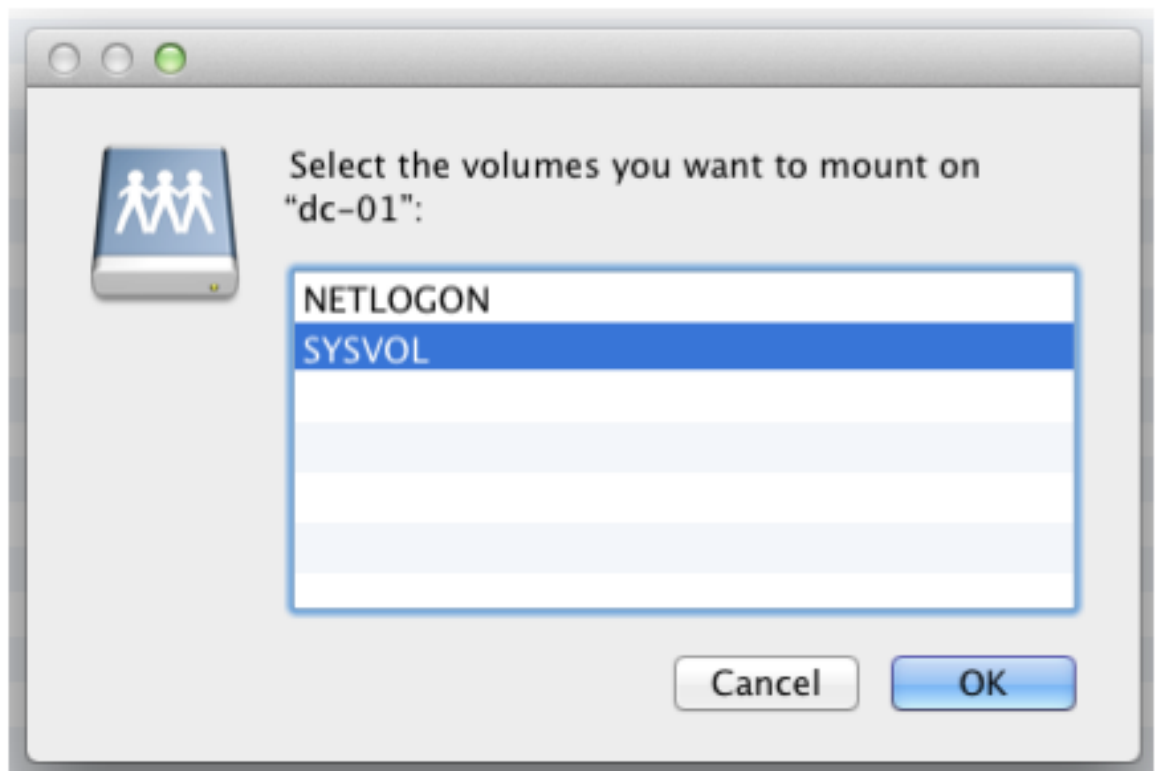

Note Be certain that the name of the folder is exactly as shown in the step above. The group policy setting allows you to specify the name of the file but the location in which it looks is always `SYSVOL\mobileconfig`. Likewise, do not create sub-folders — the group policy does not look in sub-folders.

To copy configuration files to SYSVOL on the domain controller:

1. In the Finder on the Mac computer navigate to the folder that contains the profile to copy.

• • • • •

2. Select the file, for example, `settings_for_all.mobileconfig` and copy it to the desktop. When prompted, enter your administrator password to copy the file.
3. On the desktop, change the file permissions for `settings_for_all.mobileconfig` as follows, so you can copy it to SYSVOL:
 - a. Select the file and click **File > Get Info**.
 - b. In the dialog box, expand **Sharing & Permissions**, then click the lock icon and provide administrator credentials for making changes. Set the permissions for **everyone** to **Read only**.
 - c. Reset the lock and close the open dialog.
4. On the Mac computer, copy the file from the desktop to SYSVOL on the Windows domain controller. If you are connected to the domain, you should see the domain controller in the Finder. If the domain controller is not visible in the Finder, connect to it:
 - a. Click **Go > Connect to Server** and select the domain controller.
 - b. When prompted select **SYSVOL**; for example:

- c. Navigate to the `mobileconfig` directory you created, for example

by clicking **acme.com** then **mobileconfig**.

- d. Drag the `settings_for_all.mobileconfig` file to `mobileconfig`.

To configure the “Install MobileConfig Profiles” group policy:

1. On the Windows domain controller, open the Group Policy Management Editor and select the GPO that is used to manage Mac computers.
2. Navigate to **Computer Configuration > Policies > Mac OS X Settings > Custom Settings** and double-click **Install MobileConfig Profiles** to install a machine profile.

To install a user profile, navigate to **User Configuration > Policies > Mac OS X Settings > Custom Settings** and double-click **Install MobileConfig Profiles**.

3. Select **Enabled**.
4. Click **Add**, then enter the name of the file that you copied to `sysvol`, for example, `settings_for_all.mobileconfig`.

Be certain to include the `.mobileconfig` suffix.

5. Click **OK** to add the `settings_for_all.mobileconfig` file.
6. Click **OK** to enable the policy.

This group policy will copy the `settings_for_all.mobileconfig` file, and install the profile, on every computer to which the GPO applies and that is joined to the domain. Note that after the profile is installed, it is deleted from the Mac computer.

7. Run the `adgpupdate` command on each target Mac computer to trigger an update of group policies and execute the new Install MobileConfig Profiles policy settings.

By default, group policies are updated automatically every 90 minutes, so you can skip this step and wait for the automatic update if you wish.

Note the following about this process:

- If you add a profile file to `sysvol`, but do not specify it in the group policy setting, the profile will not be installed. Likewise, if you specify a file in the group policy that does not exist in `sysvol`, the profile will not be installed.

• • • • •

- If you add new files to the existing list in the group policy, those profiles will be installed — existing profiles will not be touched.
- If you remove a file from the group policy list (after the profile for the file was installed), the profile for that file will be uninstalled from the managed Mac computers.
- If you modify a file, the corresponding profile will be reinstalled.
- If two or more profile files have the same `payloadIdentifier` attribute, only one of them will be installed.
- If you change the group policy to “Disabled” or “Not Configured”, all existing profiles that were installed previously by the group policy will now be uninstalled from the managed Mac computers.

Understanding group policies for Mac users and computers

Centrify group policies allow administrators to extend the configuration management capabilities of Windows Group Policy Objects to managed Mac computers and to users who log on to Mac computers. This chapter provides an overview to using the Centrify Mac group policies that can be applied to Mac computers and users.

The following topics are covered.

- Understanding group policies and system preferences
- Installing Mac group policies
- Setting Mac group policies
- Applying standard Windows policies to Mac OS X
- Configuring Mac-specific parameters

For reference information about the Mac OS X-specific computer and user policies that you can set, see the following topics.

- Understanding group policies for Mac users and computers
- Setting user-based group policies

For additional information about creating and using group policies and Group Policy Objects, see your Windows or Active Directory documentation, such as <https://technet.microsoft.com/en-us/windowsserver/bb310732.aspx>.

For information about other Centrify group policies that are not specific to Mac computers and users, see the *Group Policy Guide*.

Understanding group policies and system preferences

In many organizations, administrators who have both Windows and Mac computers in their organization want to manage settings for their Windows and Macintosh computers and users using a standard set of tools. In a Windows environment, the standard method for managing computer and user configuration settings is through Group Policy Objects applied to the appropriate site, domain, or organizational unit (OU) for different sets of computer and user accounts.

Centrify provides this capability for Mac computers and users through a group policy extension. The Centrify administrative template for Mac OS X (`centrify_mac_settings.xml` or `centrify_mac_settings.adm`) provides group policies that can be applied from a Windows server to control Mac OS X settings and behavior. These group policies can be applied to Mac OS X computers and to users who log on to those computers.

Through the Centrify administrative template for Mac OS X, Windows administrators using the Group Policy Management Editor can centrally access and control native Mac system preferences.

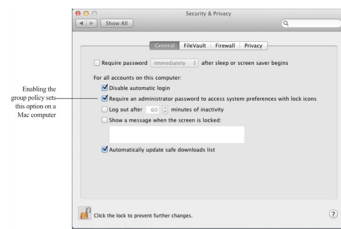

In the current Centrify administrative template for Mac OS X, Centrify group policies control settings for Personal, Hardware, Internet & Network, and System preferences, including:

- Accounts, (General) Appearance, Desktop & Screen Saver, Dock, Energy Saver, Network, Security & Privacy, Sharing, Software Update, and so on.

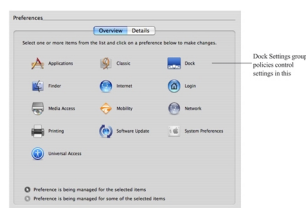

When you enable a group policy in a Windows Group Policy Object, you effectively set a corresponding system preference on the local Mac computer where the group policy is applied. For example, if you enable the group policy **Computer Configuration > Centrify Settings > Mac OS X Settings > Security > Require password to unlock each secure system preference**, it is the same as selecting the General tab of the Security & Privacy system preference, then clicking the **Require an administrator password to access system preferences with lock icons** option on a local Mac OS X computer.

Once the group policy is enabled in the Windows Group Policy Object and updated on the local Mac computer, the corresponding option is checked:

In addition to the system preferences that are typically set on individual computers, there are many Mac configuration settings that are typically set from a Mac OS X server using the Workgroup Manager. These workgroup policies control application or media access, synchronization rules for mobile user accounts, the look and operation of the Dock, and other settings. The Centrify administrative template for Mac provides centralized access to many of these Workgroup Manager settings, including Applications, Dock, Media Access, Mobility, Software Update, and System Preferences.

Note Not all group policies apply to all versions of the Mac operating environment or all computer models. If a particular system preference does not exist, is not applicable to the installed operating system, or is implemented differently on some computers, the group policy setting may be ignored or overridden by a local setting.

Group policies are available after you install the Centrify administrative template for Mac as described in [Installing the administrative template](#). After you install the administrative template, the Windows administrator can use Active Directory MMC snap-ins or the Group Policy Management Console to create and link Group Policy Objects to sites, domains, or organizational units that include Mac computers that are joined to an Active Directory domain. Administrators can then use the Group Policy Management Editor to enable and configure the specific policies they want to enforce on Mac computers that are joined to the Active Directory domain.

For more information about using Active Directory Users and Computers or the Group Policy Management Console to create and link Group Policy Objects to sites, domains, or OUs, see the *Group Policy Guide*. You can also

refer to the *Group Policy Guide* for more information about how to add other Centrify administrative templates to a Group Policy Object.

Linking Group Policy Objects

To apply group policies to Mac computers, you can link an existing group policy object (GPO) that you are using for a Windows or UNIX computer, or create a new GPO to link to a domain or OU that contains your Mac computers and users. In general, it is recommended that you create an OU specifically for your Mac computers and link a new GPO to that OU. However, there is no problem adding the Mac group policies to an existing GPO and configuring policies for Mac computers; Mac OS X-specific policies that are applied to Windows or UNIX computers are simply ignored.

You apply GPOs to Mac users the same way; link the GPO to an OU containing the users. Group policies are only applied to users and computers in the organizational unit (OU) linked to the Group Policy object (GPO) and any of the child OUs. If your users and computers are in different OUs (which is common), Centrify recommends using user Group Policy loopback processing to make sure user policies are applied to everyone who logs on to a Mac. This is a standard Microsoft Group Policy that applies to every user to the computer. See [Setting user-based policies](#) for more information about applying user policies.

Installing Mac group policies

Centrify group policies for Mac consist of two components:

- The Centrify agent for Mac and its associated configuration and system plug-in files that reside on the Mac computer. The Centrify agent and related files determine the policies that have been applied to the local computer, or to the user who is logging on, and implement the policy through system preferences or other local configuration settings. This guide assumes that you have installed the Centrify agent on your Mac computers.
- An administrative template (.xml or .admx file) that describes the policy settings available to the Group Policy Management Editor. The administrative template must be installed on a Windows computer that

has the Group Policy Management Editor and the Centrify Group Policy Management Editor Extension. The Group Policy Management Editor and the Centrify Group Policy Management Editor Extension must be available for you to enable and configure policies. See the *Mac Quick Start Guide* for more information.

Installing the administrative template

Centrify provides templates in both XML and ADMX format. In most cases it is best to use the XML templates, which provide greater flexibility, such as the ability to edit settings after setting them initially, and in many cases contain validation scripts for the policies implemented in the template.

However, in certain cases, you may want to add templates by using the ADMX files. For example, if you have implemented a set of custom tools for the Windows ADMX-based policies, and want to extend those tools to work with the Centrify policies, you can implement the policies with ADMX template files. The Group Policy Management Editor will automatically read all ADMX files stored in the %systemroot%\PolicyDefinitions\ folder.

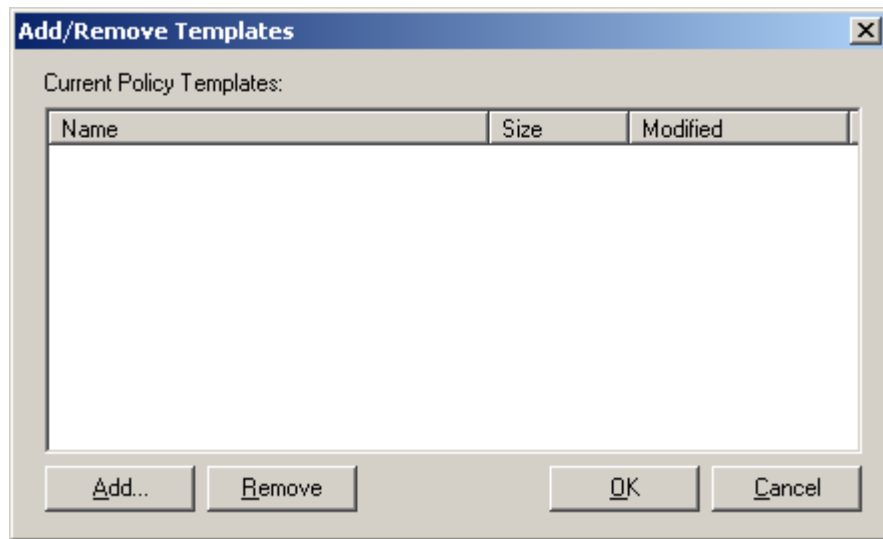

The ADMX templates do not support extended ASCII code for locales that require double-byte characters. For these locales, you should use the XML templates.

To install the Centrify XML administrative template for Mac group policies

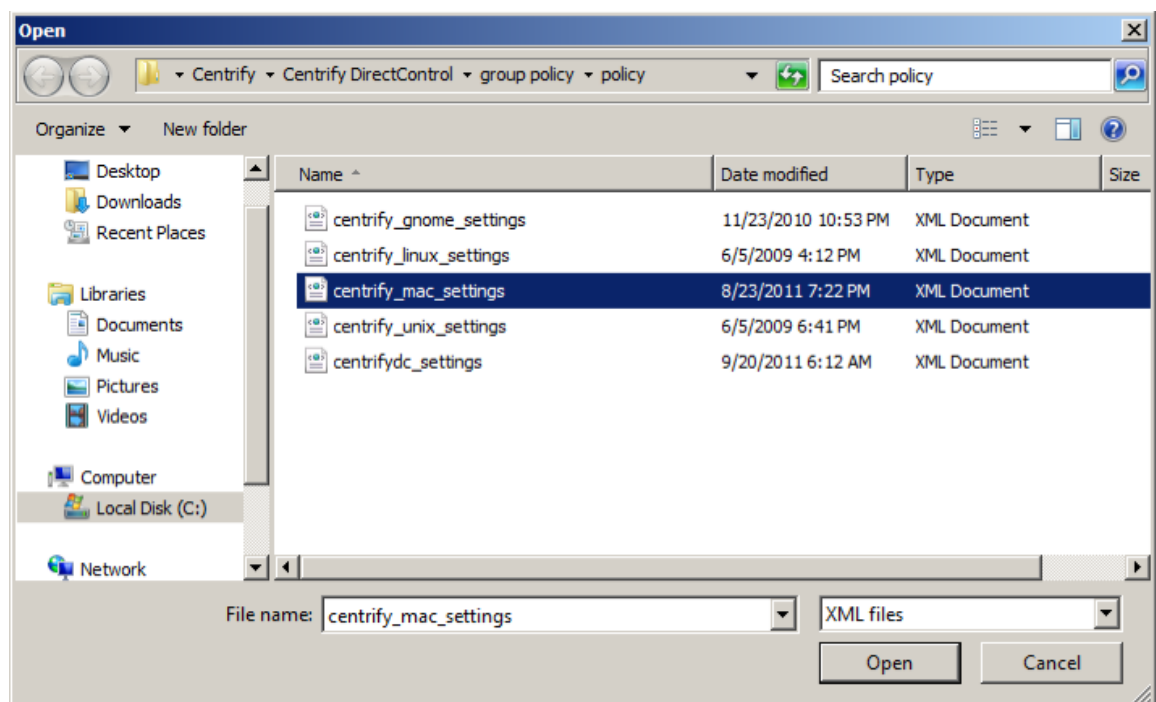

This procedure assumes that you are using the Group Policy Management Console and have created a Mac OS X-specific GPO. For information about using a different console, such as ADUC, see the *Group Policy Guide*.

1. Open the Group Policy Management Console and select the Group Policy Object that you are using for Mac computers, right-click, then click **Edit** to open the Group Policy Management Editor.
2. Expand **Computer Configuration > Policies** and select **Centrify Settings**. Right click and click **Add/Remove Templates**.
3. Click **Add**, then navigate to the directory that contains the Centrify `centrify_mac_settings.xml` administrative template. By default,

Centrify administrative templates are located in the c:\Program Files\Common Files\Centrify Shared\Group Policy Management Editor Extension\policy folder.

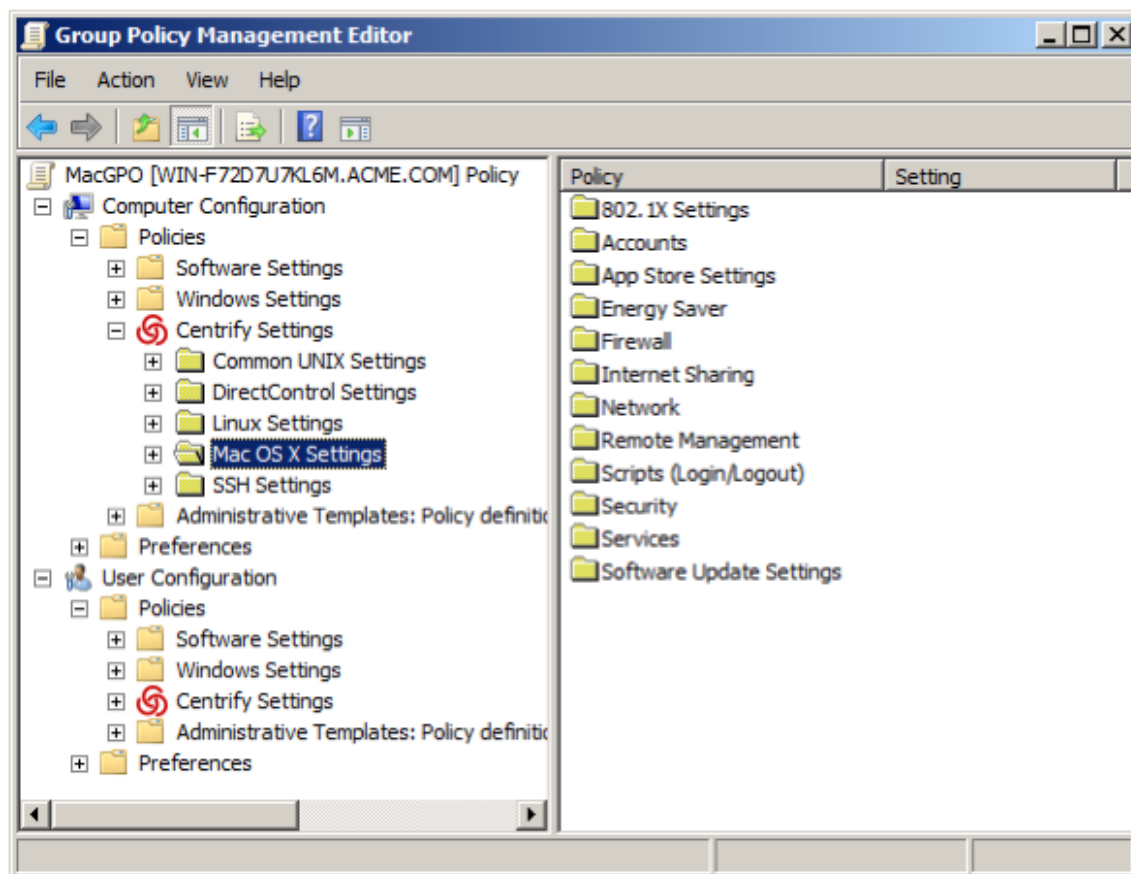

4. Select the `centrify_mac_settings.xml` file, then click **Open** to add this template to the list of Policy Templates.

5. Click **OK**.

You should now see the categories of Mac group policies listed as **Mac OS X Settings** under Centrify Settings in the Group Policy Management Editor. For example:

Note If you update Centrify to a new version, new templates may be included with the installation. To make any new policies included in the templates available for use, you must reapply each template by following the steps in one of these procedures. If you see the message, The selected XML file already exists. Do you want to overwrite it?, click **Yes**. This action overwrites the template with any new or modified group policies. It does not affect any configuration in the template that has been applied; that is, any policies that you have enabled remain enabled.

Setting Mac group policies

Like other group policies, policies for Mac users and computers are organized into categories within the Group Policy Management Editor under **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings** ([Setting computer-based group policies](#)) or **Centrify Settings > Mac OS X Settings** ([Setting user-based group policies](#)). In general, these categories map directly to different types of Mac system preferences and individual policy settings within the categories map to specific settings within the system preference.

Normally, once enabled, policies get applied at the next group policy refresh interval, after the user logs out and logs back in, or after the computer has been rebooted. Some Mac group policies, however, require the user to log out and log back in or the computer to be rebooted. The description of each group policy indicates whether the policy can be applied “dynamically” at the next refresh interval or requires a re-login or a reboot.

You may also update group policies manually by running the `adgpupdate` command on an individual computer. See [Updating configuration policies manually](#).

Note The system preference updated on an individual computer must be closed, then reopened for the group policy setting to be visible.

In most cases, group policies can be Enabled to activate the policy or Disabled to deactivate a previously enabled policy. Changing a policy to Not Configured has no effect for any Mac group policies. Once a group policy is set on a local computer, it remains in effect even if the computer leaves the Active Directory domain. The administrator or users with an administrative account can change settings manually at the local computer, but any manual change are overwritten when the group policy is applied.

Updating configuration policies manually

Although there are Windows group policy settings that control whether group policies should be refreshed in the background at a set interval, Centrify also provides a command line program to manually refresh group policy settings at any time. This command line program, `adgpupdate`, forces the `adclient` daemon to contact Active Directory and collect group policy settings. With the `adgpupdate` command, you can specify whether you want to refresh computer configuration policies, user configuration policies, or both.

When you run the `adgpupdate` command, the `adclient` daemon does the following:

- Contacts Active Directory for computer configuration policies, user configuration policies, or both. By default, `adclient` collects both computer and user configuration policies.

- Determines all of the configuration settings that apply to the computer, the current user, or both, and retrieves those settings from the System Volume (SYSVOL).
- Writes all of the configuration settings to a virtual registry on the local computer.
- Starts the runmappers program to initiate the mapping of configuration settings using individual mapping programs for user and computer policies.
- Resets the clock for the next refresh interval.

For more information about using the `adgpupdate` command, see the `adgpupdate` man page or “Using `adgpupdate`” in the *Administrator’s Guide for Linux and UNIX*.

Applying standard Windows policies to Mac OS X

Every Group Policy Object includes several default Windows-based group policy categories and default Windows-based administrative templates for user and computer configuration. Most of the settings in the default Windows policies and administrative templates only apply to Windows computers and Windows user accounts. However, some of the common Windows configuration settings for password enforcement, such as the policies for minimum password length and complexity, do apply to Mac computers. If these settings are enabled for a Group Policy Object applied to a site, domain, or OU that includes Mac OS X computers, the settings are enforced for Mac users and computers.

The following sections describe the standard Windows group policies that you can apply to Mac computers and users and where you can find these policies when viewing a Group Policy Object in the Group Policy Management Editor.

Group Policy refresh and loopback processing

The **Computer Configuration > Administrative Templates > System > Group Policy** object contains the following policies that you can use to control how group policies are refreshed and applied.

• • • • •

- Turn off background refresh of Group Policy
- Group Policy refresh interval for computers
- User Group Policy loopback processing mode

Synchronizing time

By default, the local Network Time Protocol (NTP) Client is enabled and synchronizes your computer's clock to the Domain Controller. If you do not want your local NTP service to synchronize to the NTP service on the Domain Controller, explicitly disable the (Windows) Enable Windows NTP Client group policy. You can also synchronize to a different NTP server by specifying one in the Configure Windows NTP Client group policy.

To set these policies, in the Group Policy Editor, click **Computer Configuration > Administrative Templates > System > Windows Time Service > Time Providers**. The following policies are available to control time synchronization settings.

- Enable Windows NTP Client
- Configure Windows NTP Client

Specifying time sync polling interval

The **Computer Configuration > Administrative Templates > System > Windows Time Service > Global Configuration Settings** policy allows you to control the max polling interval with the `MaxPollInterval` option.

Configure interactive log on

Select the **Computer Configuration > Windows Settings > Security Settings > Local Policies > Security Options** object to configure the following policies related to interactive log on.

Note These policies apply to SSH login only, not to login through the graphical user interface.

- Interactive logon: Message text for users attempting to log on
- Interactive logon: Prompt user to change password before expiration

Set password requirements

Select the **Computer Configuration > Windows Settings > Security Settings > Account Policies > Password Policy** object to set password requirements.

- Enforce password history
- Maximum password age
- Minimum password age
- Minimum password length
- Password must meet complexity requirements
- Store passwords using reversible encryption

Configuring Mac-specific parameters

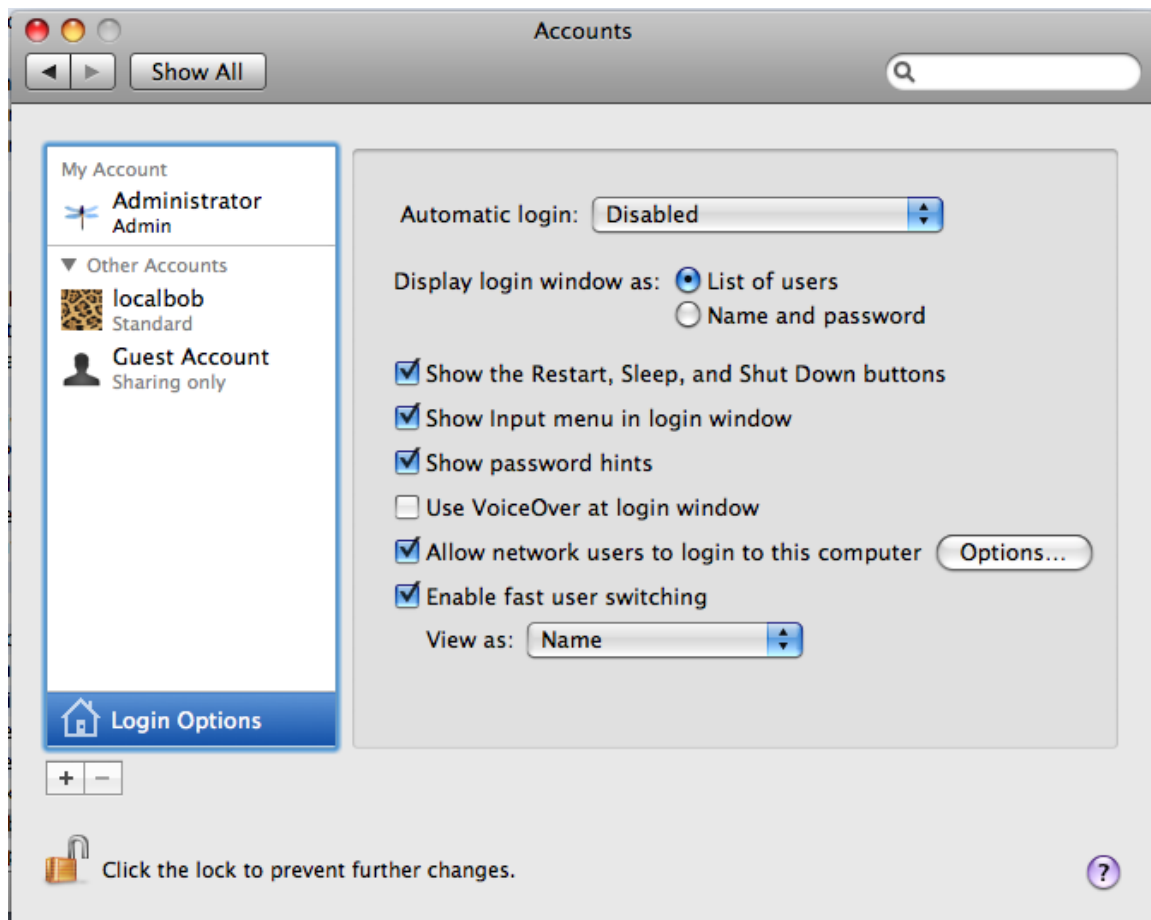

Most configuration parameters apply to both Mac or only to actual UNIX or Linux systems. All these parameters are described in the *Configuration and Tuning Reference Guide*. However, the following parameters apply only to Mac OS X and are described in this section.

- `adclient.autoedit.mac.netlogin`
- `adclient.mac.map.home.to.users`
- `adclient.network.wait.max`
- `mac.auto.generate.new.login.keychain`
- `mac.protected.keychain.enable`
- `mac.protected.keychain.user.default`
- `mac.protected.keychain.delete`
- `mac.protected.keychain.lock.inactivity`
- `mac.protected.keychain.lock.when.sleeping`
- `mac.keychain.sync.enabled`

- `mac.keychain.sync.polling.interval`
- `smartcard.pin.caching.disable`
- `logger.login.log`

`adclient.autoedit.mac.netlogin`

System Preferences > Users & Groups (Accounts) has a login option: **Allow network users to log in at login window:**

If this option is deselected, Active Directory users will not be able to log into the computer. The configuration parameter `adclient.autoedit.mac.netlogin` controls whether this option can be deselected by users. By default, the parameter is true in the `/etc/centrifydc/centrifydc.conf` file:

```
adclient.autoedit.mac.netlogin: true
```

• • • • •

In this case, even if a user deselects the box, the box is selected again when `adcli`ent is restarted, effectively preventing a user from deactivating network login.

If you want to allow a user to deactivate network login, set the parameter to `false`. If a user deselects network login in **System Preferences > Accounts**, the next time `adcli`ent starts, network users will be unable to log in to the computer.

`adcli`ent.mac.map.home.to.users

On some versions of Mac OS X, `/home` is an automount point. If a zone user's home directory is set to `/home/username`, the operating system cannot create the home directory and the user cannot log in. Therefore, you should not specify `/home/username` as the home directory for any Mac OS X users, but since this is a typical UNIX home directory, there may be Active Directory users who have a `/home/username` home directory.

To avoid potential problems, you can configure Centrify to change `/home/username` to `/Users/username` (the default Mac OS X home directory), in one of two ways:

- Enable the group policy, [Map /home to /Users](#).
- Set this parameter, `adcli`ent.mac.map.home.to.users to `true` to enable the change for the local computer only; for example:

```
adclient.mac.map.home.to.users:true
```

`adcli`ent.network.wait.max

The Centrify agent for Mac OS X performs network checks during startup to determine whether the device is connected to the domain. The `adcli`ent.network.wait.max parameter sets the maximum time the agent waits for the network before deciding to boot in either connected or disconnected mode. The default value is five seconds.

If DNS latency is high in your environment, the agent might determine that the device is in a Disconnected state too soon.

You can increase the value for the `adclient.network.wait.max` parameter if it's appropriate for your network environment; however, this might result in increased boot times.

logger.login.log

Login events are captured in `/var/log/centrifydc-login.log` by default. You can turn off this feature by setting the `logger.login.log` parameter to off. Refer to [Collecting information specific to login events](#) for more information about `/var/log/centrifydc-login`.

mac.auto.generate.new.login.keychain

Use this parameter to automatically generate a new login keychain if a user's keychain password does not match the password they used to successfully login.

The default value is `false`.

Refer to [Auto Generate New Login Keychain](#) for more information about the group policy that controls this parameter.

mac.protected.keychain.enable

Setting this parameter to `true` creates a new keychain protected by either an asymmetric token stored on a smart card or by a password, depending on the log in type.

The default value is `false`.

Refer to [Enable protected keychain](#) for more information about the group policy that controls this parameter.

Note Changing the group policy setting for this parameter does not change the parameter's value in this file. The two are set independently, with the group policy setting taking priority.

• • • • •

mac.protected.keychain.user.default

Setting this parameter to `true` sets the protected keychain as the default keychain for that user.

The default value is `true`.

Refer to [Enable protected keychain](#) for more information about the group policy setting that controls this parameter.

Note Changing the group policy setting for this parameter does not change the parameter's value in this file. The two are set independently, with the group policy setting taking priority.

mac.protected.keychain.delete

Setting this parameter to `true` deletes the existing password-protected Login Keychain after logging in.

The default value is `false`.

Note This parameter only works if [mac.protected.keychain.enable](#) is set to `true`.

Refer to [Enable protected keychain](#) for more information about the group policy setting that controls this parameter.

Note Changing the group policy setting for this parameter does not change the parameter's value in this file. The two are set independently, with the group policy setting taking priority.

mac.protected.keychain.lock.inactivity

Use this parameter to set the period of inactivity in minutes to automatically lock the protected keychain.

The default value is `0`, which means the protected keychain is never automatically locked.

Refer to [Lock protected keychain after number of minutes of inactivity](#) for more information about the group policy that controls this parameter.

Note Changing the group policy setting for this parameter does not change the parameter's value in this file. The two are set independently, with the group policy setting taking priority.

mac.protected.keychain.lock.when.sleeping

Setting this parameter to `true` locks the protected keychain when the Mac sleeps.

The default value is `false`.

Refer to [Lock protected keychain when sleeping](#) for more information about the group policy that controls this parameter.

Note Changing the group policy setting for this parameter does not change the parameter's value in this file. The two are set independently, with the group policy setting taking priority.

mac.keychain.sync.enabled

This configuration parameter enables Keychain synchronization for the users on a mac.

If this parameter is enabled, the current login user will receive a password change notification when his/her password is changed remotely. When the user clicks on the notification, the Centrify Keychain Sync utility appears and allows the user to synchronize the Keychain password.

Note Password changes can only be detected when the machine is in connected mode.

The default value is `false`.

Refer to [Enable Keychain synchronization](#) for more information about the related group policy.

mac.keychain.sync.polling.interval

This configuration parameter sets the password change detection interval when [mac.keychain.sync.enabled](#) is enabled.

• • • • •

This parameter determines the time (in minutes) between checking for changed passwords. There is a random zero to five minute variance in the actual interval each device is checked for a changed password to maintain performance. As a result, the minimum interval is five minutes.

Note Valid intervals are between 5 minutes and 1440 minutes (1 day).

The default value is 30.

Refer to [Enable Keychain synchronization](#) for more information about the related group policy.

smartcard.pin.caching.disable

Default system behavior allows for caching the smart card PIN for operations that come in close succession.

Set this parameter to `true` to disable pin caching for smart cards.

The default value is `false`.

Setting computer-based group policies

Centrify group policies allow administrators to extend the configuration management capabilities of Windows Group Policy Objects to managed Mac computers and to users who log on to Mac computers. This chapter provides reference information for the Centrify Mac group policies that can be applied specifically to Mac computers.

The computer-based group policies are defined in the Centrify Mac administrative template (`centrify_mac_settings.xml`) and accessed from **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings**. See [Understanding group policies for Mac users and computers](#) for general information about how Centrify uses group policies to manage Mac settings and for information on how to install the group policy administrative templates.

For reference information about user-based policies, see [Setting user-based group policies](#).

For information about applying standard Windows policies to Mac OS X, see [Applying standard Windows policies to Mac OS X](#) and for information about Mac OS X-specific parameters, see [Configuring Mac-specific parameters](#).

Note For more complete information about creating and using group policies and Group Policy Objects, see your Windows or Active Directory documentation. For more information about adding and using other Centrify group policies that are not specific to Mac computers and users, see the *Group Policy Guide*

Setting computer-based policies for Mac

The following table provides a summary of the group policies you can set for Mac computers. These group policies are in the Centrify Mac administrative template (`centrify_mac_settings.xml`) and accessed from **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings**.

Use this policy	To do this
Allow certificates with no extended key usage certificate attribute	For smart card log in, allow the use of certificates that do not contain the extended key usage (EKU) attribute. This is a Windows policy that is defined in the Administrative Templates > Windows Components > Smart Card folder using an adm template.
Map /home to /Users	Map the <code>/home/username</code> directory to <code>/Users/username</code> . This is a Mac OS X-specific policy but defined in the Direct Control Settings > Adclient Settings folder using the <code>centrifydc_settings.xml</code> template.
802.1X Settings	Create login and system profiles for wireless authentication. These group policies correspond to 802.1X Options in the Networks system preference.
Accounts	Control the look and operation of the login window on Mac computers and map zone groups to the local administrator group. These group policies correspond to Login Options in the Accounts system preference.
App Store Settings (Deprecated)	Control the users and groups who can access the App Store. These group policies correspond to settings in the Sleep and Options panes in the Energy Saver system preference.
Custom Settings	Customize and install configuration profiles.
Energy Saver	Control sleep and wake-up option on Mac computers. These group policies correspond to settings in the Sleep and Options panes in the Energy Saver system preference.
Firewall	Control the firewall configuration on Mac computers. These group policies correspond to settings in the Firewall pane of the Sharing system preference.

Use this policy	To do this
Internet Sharing	<p>Manage Internet connections on Mac computers.</p> <p>These group policies correspond to settings in the Internet pane of the Sharing system preference.</p>
Network	<p>Control DNS searching and proxy settings.</p> <p>These group policies correspond to settings in the TCP/IP and Proxies panes of the Network system preference.</p>
Remote Management	<p>Control Apple Remote Desktop access for zone users. These group policies correspond to the Manage > Change Client Settings options in Apple Remote Desktop.</p>
Security & Privacy	<p>Control security settings on Mac computers.</p> <p>These group policies correspond to settings in the Security system preferences.</p>
Services	<p>Control access to various services on Mac computers.</p> <p>These group policies correspond to settings in the Services pane of the Sharing system preference.</p>
Software Update Settings	<p>Control the options for automatic software updates on Mac computers.</p> <p>These group policies correspond to settings in the Software Update system preference.</p>

For information about specific policies and how to set them, see the policy description (Explain text) or the corresponding discussion of the specific system preference or individual setting in the Mac Help.

Allow certificates with no extended key usage certificate attribute

Path

Computer Configuration > Policies > Administrative Templates: Policy Definitions> Windows Components> Smart Card.

Description

The group policy, “Allow certificates with no extended key usage certificate attribute” is defined in a Windows administrative template file (.adm), not in `centrify_mac_settings.xml`, and is in Administrative Templates, not in Mac Settings.

To enable or disable this policy, click **Computer Configuration > Policies > Administrative Templates: Policy Definitions > Windows Components > Smart Card**.

Enabling this policy setting allows the use of certificates for smart card login that do not have the Extended Key Usage (EKU) attribute set. Normally, certificates that are used for smart card login require this attribute with a smart card logon object identifier.

When you enable this policy, it sets the `smartcard.allow.noeku` parameter to true in the Centrify configuration file. Certificates with the following attributes can also be used to log on with a smart card:

- Certificates with no EKU
- Certificates with an All Purpose EKU
- Certificates with a Client Authentication EKU

If you disable or do not configure this policy setting (and do not set the `smartcard.allow.noeku` parameter to true in the Centrify configuration file) only certificates that contain the smart card logon object identifier can be used with smart card log in.

After changing the value of this parameter, you must re-enable smart card support by running the following `sctool` command as root:

```
[root]$ sctool -E
```

Note You must also specify the `--altpkinit` or `--pkinit` parameter when you run `sctool` with the `-E` option.

Map /home to /Users

Path

Computer Configuration > Policies > Centrify Settings > DirectControl Settings > Adclient Settings.

Description

The Mac group policy, Map /home to /Users is defined in the `centrifydc_settings.xml` file, not in `centrify_mac_settings.xml`, and is in Centrify Settings, not in Mac Settings.

To enable or disable this policy, click **Computer Configuration > Policies > Centrify Settings > DirectControl Settings > Adclient Settings**.

On some versions of Mac OS X, /home is an automount point. If a zone user's home directory is set to `/home/username`, the operating system cannot create the home directory and the user cannot log in. Therefore, you should not specify `/home/username` as the home directory for any Mac users, but since this is a typical UNIX home directory, there may be Active Directory users who have a `/home/username` home directory. To avoid potential problems, enable this group policy, Map /home to /Users, to configure Centrify to change `/home/username` to `/Users/username` (the default Mac home directory). If you do not enable this policy, the change does not take effect.

This policy modifies the `adclient.mac.map.home.to.users` parameter in the Centrify configuration file.

802.1X Settings

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > 802.1X Wireless Settings

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > 802.1X Settings** to create profiles for wireless network authentication. The profiles you specify with these group policies are created in the Network system preferences pane.

Enable Machine Ethernet Profile

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > 802.1X Wireless Settings > Enable Machine Ethernet Profile

Description

Enable this policy to create an 802.1X ethernet profile so users can authenticate to an 802.1X-protected network by using the specified machine certificate.

This policy only applies to Mac OS X 10.7 and later.

This policy supports the TLS protocol for certificate-based authentication for computers.

Before you can enable this policy, you must have a Windows server configured for 802.1X wireless authentication. The configuration includes certificate templates that are configured for auto-enrollment of domain computers and automatically downloaded to Mac computers when they join the domain. See [Configuring 802.1X wireless authentication](#) for details about what you must configure before enabling the current policy.

After enabling this policy, set the following:

- **Template Name:** Type the name of the auto-enrollment machine certificate that has been pushed down from the Windows domain server. When pushed to a Mac computer, certificate names are prepended with `auto_`; for example:

• • • • •

`auth_Centrify-1X`

This group policy runs a script that looks for the specified certificate template in the `/var/centrify/net/certs` directory (which contains the certificate templates pushed down from the domain controller) and creates an Ethernet profile from this certificate.

Once enabled, this policy takes effect dynamically at the next group policy refresh interval.

Enable Machine Wi-Fi Profile

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > 802.1X Wireless Settings Enable Machine Wi-Fi Profile

Description

Enable this policy to create an 802.1X Wi-Fi profile for wireless network authentication for a computer.

This policy only applies to Mac OS X 10.7 and later.

This policy supports WEP or WPA/WPA2 security with the TLS protocol for certificate-based authentication for computers.

Before you can enable this policy, you must have a Windows server configured for 802.1X wireless authentication. The configuration includes certificate templates that are configured for auto-enrollment of domain computers and automatically downloaded to Mac computers when they join the domain. See [Configuring 802.1X wireless authentication](#) for details about what you must configure before enabling the current policy.

After enabling this policy, set the following:

- **SSID:** Type the SSID for the wireless network.
- **Template Name:** Type the name of the auto-enrollment machine certificate that has been pushed down from the Windows domain server.

When pushed to a Mac computer, certificate names are prepended with `auto_`; for example:
`auth_Centri fy-1X`

This group policy runs a script that looks for the specified certificate template in the `/var/centri fy/net/certs` directory (which contains the certificate templates downloaded from the domain controller) and creates a WiFi profile from this certificate.

- **Security Type:** Select the security type from the drop-down list.
- **Other options:** Select one or more of the following options:
 - **Auto join:** Select this option to specify that the computer automatically join a Wi-Fi network that it recognizes. Do not select this option to specify that the logged in user must manually join a Wi-Fi network.
 - **Hidden network:** Select this option if the Wi-Fi network does not broadcast its SSID.
 - **Proxy PAC URL:** The URL of the PAC file that defines the proxy configuration. You can enter any string without spaces.
 - **Proxy PAC Fallback:** Allows the device to connect directly to the destination if the PAC file is unreachable. This option is disabled by default.

Once enabled, this policy takes effect dynamically at the next group policy refresh interval.

Enable User Ethernet Profile

Path

Computer Configuration > Policies > Centrif y Settings > Mac OS X Settings > 802.1X Wireless Settings > Enable User Ethernet Profile

Description

Enable this policy to create an 802.1X ethernet profile so users can authenticate to an 802.1X-protected network by using the specified user certificate.

This policy only applies to Mac OS X 10.7 and later.

This policy supports the TLS protocol for certificate-based authentication for users.

By default, the auto-enrolled user certificates are pushed down to `~/ .centrify/autouser_(name).{cert.key.chain}`. Certificates are also imported into each user's login keychain.

Before you can enable this policy, you must have a Windows server configured for 802.1X wireless authentication. The configuration includes certificate templates that are configured for auto-enrollment of domain computers and automatically downloaded to Mac computers when they join the domain. See [Configuring 802.1X wireless authentication](#) for details about what you must configure before enabling the current policy.

Users must perform these steps after login to authenticate to the network as the user:

1. Select **System Preferences > Network > Ethernet**.
2. If there are any pre-existing 802.1X connections, click **Disconnect** to disconnect the pre-existing connections. For example, if a machine 802.1X Ethernet policy has been set, the computer will already be authenticated using the machine credential.
3. Click **Connect**. This action prompts the user with a list of available user identities in *certificate-key* pair format.
4. Choose the appropriate auto-enrolled user identity.

Enable User Wi-Fi Profile

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > 802.1X Wireless Settings > Enable User Wi-Fi Profile

Description

Enable this policy to create an 802.1X Wi-Fi profile for wireless network authentication for a user.

This policy only applies to Mac OS X 10.7 and later.

This policy supports the TLS protocol for certificate-based authentication for users.

By default, the auto-enrolled user certificates are pushed down to `~/ .centrify/autouser_(name).{cert.key.chain}`. Certificates are also imported into each user's login keychain.

The resulting profile is signed using the first available auto-enrolled machine certificates, which are under `/var/centrify/net/certs/auto_(name).{cert.key.chain}`. If an auto-enrolled machine certificate is not available, the profile will be unsigned.

Before you can enable this policy, you must have a Windows server configured for 802.1X wireless authentication. The configuration includes certificate templates that are configured for auto-enrollment of domain computers and automatically downloaded to Mac computers when they join the domain. See [Configuring 802.1X wireless authentication](#) for details about what you must configure before enabling the current policy.

After enabling this policy, set the following:

- **SSID:** Type the SSID for the wireless network.
- **Security Type:** Select the security type from the drop-down list.
- **Other options:** Select one or more of the following options:
 - **Auto join:** Select this option to specify that the computer automatically join a Wi-Fi network that it recognizes. Do not select

this option to specify that the logged in user must manually join a Wi-Fi network.

- **Hidden network:** Select this option if the Wi-Fi network does not broadcast its SSID.
- **Proxy PAC URL:** The URL of the PAC file that defines the proxy configuration. You can enter any string without spaces.
- **Proxy PAC Fallback:** Allows the device to connect directly to the destination if the PAC file is unreachable. This option is disabled by default.

Users must perform these steps after login to authenticate to the network as the user:

1. Select **System Preferences > Network > Wi-Fi**.
2. If there are any pre-existing 802.1X connections, click **Disconnect** to disconnect the pre-existing connections. For example, if a machine 802.1X Ethernet policy has been set, the computer will already be authenticated using the machine credential.
3. Click **Connect**. This action prompts the user with a list of available user identities in *certificate-key* pair format.
4. Choose the appropriate auto-enrolled user identity (a *certificate-key* pair).

Specify System Profile (deprecated)

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > 802.1X Wireless Settings > Specify System Profile (Deprecated)

Description

This group policy is provided for backward compatibility with Mac OS X 10.6. If your environment does not contain any 10.6 computers, do not use this group policy.

Enable this policy to specify 802.1X system profile for wireless network authentication.

System profile can establish a wireless connection without a user login.

To add a system profile, enable the policy and click **Add** to enter the profile name and setting, then type a name for the profile.

The setting must follow this format:

- Network;Security Type;Authentication Method, where each field is separated by a semi-colon (;)
- Network is the wireless network name
- Security type is one of 802.1X WEP, WPA Enterprise, WPA2 Enterprise
- Authentication method is one or more of the following, separated by commas: TTLS, PEAP, LEAP, MD5

For example:

OFFICE1;WPA Enterprise;PEAP

OFFICE2;802.1X WEP;TTLS, PEAP

Automatically turn on Airport; to automatically turn on AirPort device if this type of profile is specified. Otherwise, the status of the AirPort device will not change.

Once enabled, this policy takes effect dynamically at the next group policy refresh interval.

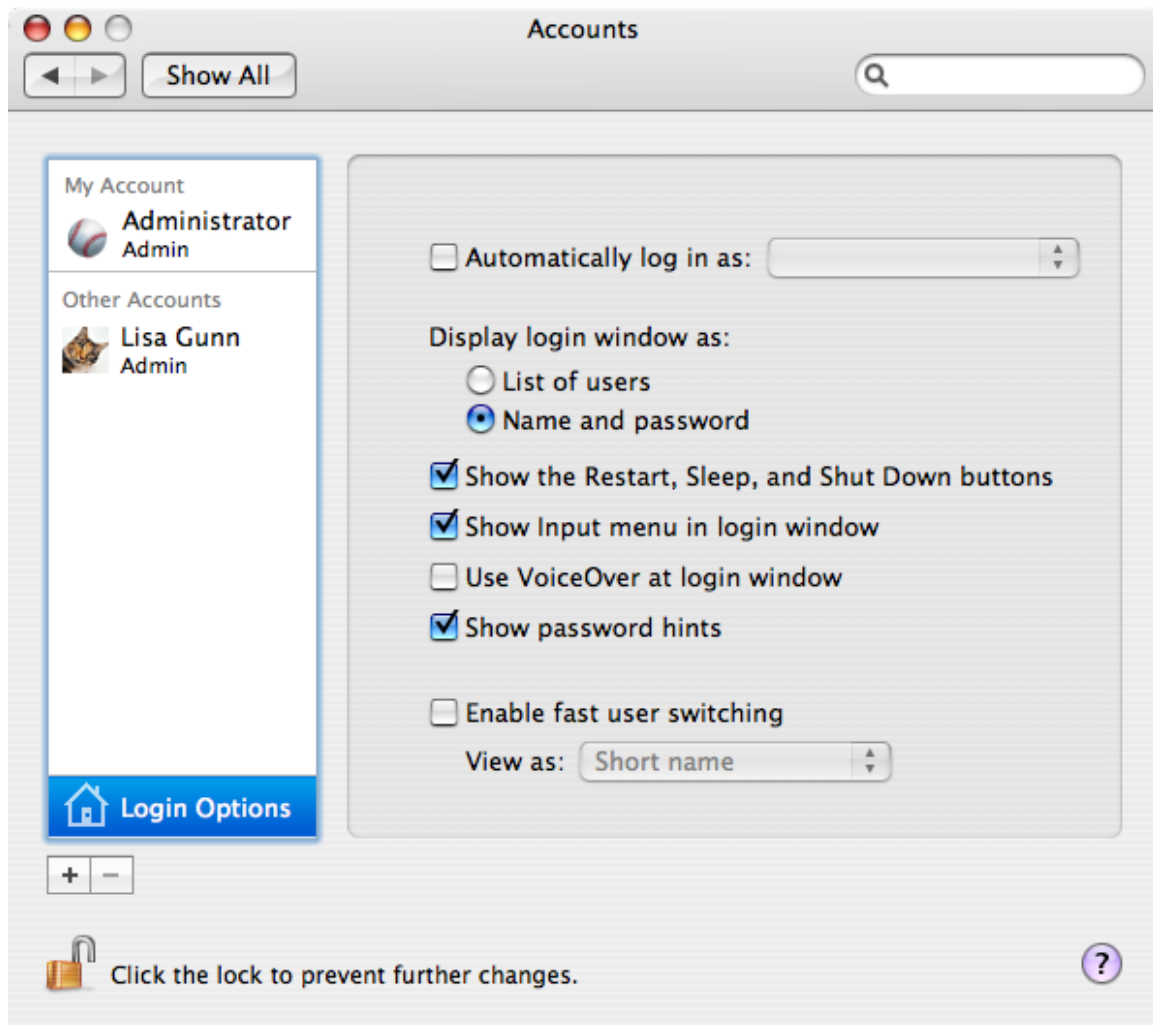

Accounts

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Accounts

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Accounts** settings to manage the options from the Accounts () system preference on Mac computers. These group policies correspond to the options displayed when you select the **Accounts** system preference, then click **Login Options**. For example:

Set login window settings

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Accounts > Set login window settings

Description

Configure the Login Options on a computer. If you enable this policy, you can configure the Login Window to:

- Display a text string as a login banner. The Banner you specify is displayed when the user is prompted to log on.
- Display a List of Users or a Name and Password field. Displaying the Name and Password requires users to provide their account name and password, and is more secure than displaying a list of user names.
- Show the Restart, Sleep, and Shut Down buttons.
- Show the Input menu in the login window to allow users to change the current Keyboard Layout.
- Show password hints in the login window.
- Use VoiceOver at the login window.
- Enable fast user switching.
- Display the HostName, IP Address, and OS X or macOS Version. Users need to click the clock in the top right corner to view each field.
- Disable reopening applications when logging back in. Check this to always uncheck the **Reopen Windows when logging back in** checkbox at logout, restart, or shutdown.
- Hide all Local Users with a UID less than 500.
- Enabling the options in this group policy is the same as clicking **Login Options** in the Accounts system preference and setting the corresponding login window options.

Note This policy does not impact lock screens. It only impacts the login window.

Note If you click **Enable Fast User Switching**, this setting does not take effect until the Login Options in the Accounts system preference is opened manually by a user on the local host. This step is required to display the list of users in the upper-right corner of the menu bar. After users log on, the user's full name, short name, or icon identifier is displayed in the menu bar. If you want to change how users are displayed in the menu, you also must do so manually from the Login Options in the Accounts system preference.

• • • • •

Once enabled, this group policy takes effect when users log out and log back in or when the computer is rebooted.

Map zone groups to local admin group

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Accounts > Map zone group to local admin group

Description

Specify one or more zone groups to map to the admin group on the local computer. Members of the groups you specify here have administrative privileges on the local computer, including:

- The use of `sudo` command in a shell
- The ability to unlock and make changes to System Preferences.

Be certain to create a zone group in Access Manager (or `adedit`) and add users who you want to have administrative privileges on managed Mac computers.

Note If the local computer is connected to the domain through Auto Zone, you cannot create a zone group because there are no zones. However, all Active Directory groups are valid for the joined computer, so you can map any group to the local admin group, but you need to know the group's UNIX name, which you can retrieve on the local computer by using the `adquery` command, as shown in the following example.

```
[root]#adquery group -n
```

To set this policy

1. Open the policy and select **Enabled**.
2. Click **Add**.
3. Enter the name of a zone group in the box (or the UNIX group name if connected through Auto Zone). Then click **OK**.

Map zone groups to local group

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Accounts > Map zone group to local group

Description

Specify one or more zone groups to map to a Mac local group on the local computer. Members of the zone groups you specify here will be given the privileges of the local group on the local computer; for example,:

- If you map to the `_lpadmin` and `_lpoperator` local groups, members of the zone group can manage printer settings on the local computer.
- If you map to the `admin` local group, members of the zone group obtain administrator privileges on the local computer.

Note To obtain administrator privileges for a zone group, you can either map to the local `admin` group with this policy, or use the Map zone groups to local `admin` group policy. However, do not do both as the results are unpredictable.

Be certain to create a zone group in Access Manager (or `adedit`) and add users who you want to have administrative privileges on managed Mac computers.

Note If the local computer is connected to the domain through Auto Zone, you cannot create a zone group because there are no zones. However, all Active Directory groups are valid for the joined computer, so you can map any group to the local `admin` group, but you need to know the group's UNIX name, which you can retrieve on the local computer, by using the `adquery` command, as follows

```
[root]#adquery group -n
```

To set this policy

• • • • •

1. Open the policy and select **Enabled**.
2. Click **Add**.
3. Enter the name of a local group and of a zone group in the respective boxes (or the UNIX group name if connected through Auto Zone), then click **OK**.

You can repeat this step multiple times to map the zone group to more than one local group.

App Store Settings (Deprecated)

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > App Store Settings (Deprecated)

Description

Note This policy has been deprecated and is no longer supported. Enabling it will have no effect. It is provided simply to allow you to disable the policy if it was set in an earlier version of the product. You can use the [Application Access Settings](#) group policies to control access to the App Store if you wish.

Prohibit Access to the App Store (Deprecated)

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > App Store Settings (Deprecated) > Prohibit Access to the App Store (Deprecated)

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > App Store > Prohibit Access to App Store** group policy to control access to the App Store.

By default, all users can access the App Store. Enable this group policy to prohibit access to App Store to all users except the root user and those you specifically authorize with the options, **Allow these users to access App store**, and **Allow these groups to access App Store**.

You can set the following options with this policy:

Use this option	To do this
Allow these users to access App Store	The names of local or AD users who are allowed to access the App Store. When this policy is enabled, only users on this list and the root user are allowed to access the App Store.
Allow these groups to access App Store	The names of local or AD groups that are allowed to access the App Store. When this policy is enabled, only users in the specified groups, and the root user, are allowed to access the App Store.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Custom Settings

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Custom Settings

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Custom Settings** group policy settings to customize and install configuration profiles. The “Install MobileConfig Profiles” policy installs a device profile. To install a user profile, use the same policy in **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Custom Settings**.

Custom Settings includes the following policies.

Enable profile custom settings

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Custom Settings > Enable profile custom settings

Description

Enable this group policy to use the Custom payload to specify preference settings for applications that use the standard plist format for their preference files.

You can use this GP to add specific keys and values to an existing preferences plist file. However, not all applications work with managed preferences, and in some cases only specific settings can be managed.

By default you should place the plist files with preference settings in the folder `\\domain\SYSTEM\<domain>\customsettings`.

To add a file, click **Add** and enter name of a file that you placed in the SYSTEM location. The file you specify is relative to this path:

```
\\domain\SYSTEM\domain\customsettings
```

For example, if you enter:

```
com.apple.plist
```

the file that is imported is:

• • • • •

```
\\domain\SYSVOL\domain\customsettings\com.apple.plist
```

Install MobileConfig Profiles

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Custom Settings > Install MobileConfig Profiles

Description

Enable this group policy to install mobile configuration profiles on managed Mac computers.

Note There is a Computer Configuration version of this policy (which installs device profiles) and a User Configuration version (which installs user profiles).

Before enabling this policy, you must create a directory and copy mobile configuration files to SYSVOL on the domain controller. SYSVOL is a well-known shared directory on the domain computer that stores server copies of public files that must be shared throughout the domain.

Specifically, create the following directory on the domain controller:

```
\\domainName\SYSVOL\domainName\mobileconfig
```

and copy one or more mobile configuration profile files to this directory. See [Deploy configuration profiles to multiple computers](#) for details on how to do this.

To specify mobile configuration files to install, enable the policy, then click **Add**. Enter the name of a mobile configuration file that you placed in SYSVOL on the domain controller. Include the `.mobileconfig` suffix with the name.

If you specify a file that is not in the SYSVOL mobileconfig directory, the profile will not be installed.

If you add new files to the existing list in the group policy, those profiles will be installed — existing profiles will not be touched. If you remove previously specified files, the profiles defined by these files will be uninstalled.

• • • • •

If you add two or more profile files that have the same `payloadIdentifier`, only one of them will be installed.

If you change the group policy to “Disabled” or “Not Configured”, all existing profiles that were installed previously by the group policy will now be uninstalled from the managed Mac computers.

Energy Saver

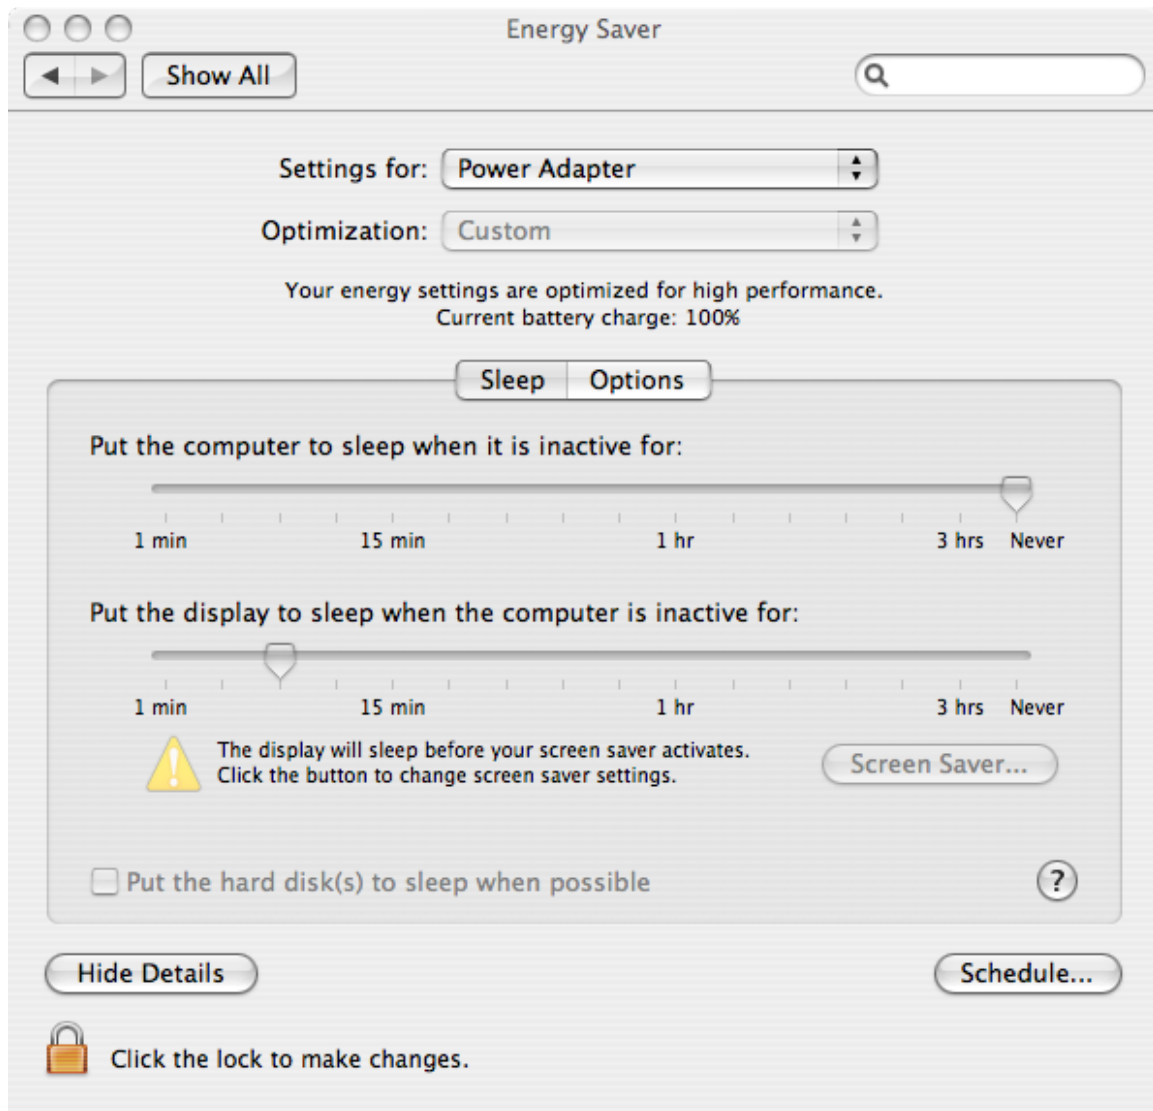

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Energy Saver

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Energy Saver** settings to manage sleep and wake-up options from

the Energy Saver () system preference on Mac computers. For example:

You can configure power options or schedule startup and shutdown times.

Open the appropriate folder to set power options when running on AC power or battery power. Each folder has the identical set of group policies:

- On AC power
- On battery power

Allow power button to sleep the computer

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Energy Saver > Allow power button to sleep the computer

Description

Allow the power button to sleep the computer.

Enabling this group policy is the same as selecting the **Allow power button to sleep the computer** option in the Options pane of Energy Saver system preference.

This policy can take effect dynamically at the next group policy refresh interval.

Put the hard disk(s) to sleep when possible

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Energy Saver > Put the hard disk(s) to sleep when possible

Description

Put computer hard disks to sleep when they are inactive.

Enabling this group policy is the same as selecting the **Put the hard disk(s) to sleep when possible** option in the Sleep pane of Energy Saver system preference.

This policy can take effect dynamically at the next group policy refresh interval.

Restart automatically after a power failure

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Energy Saver > Restart automatically after a power failure

Description

Enable to set the computer to automatically restart after a power failure.

Enabling this group policy is the same as selecting the **Restart automatically after a power failure** option in the Options pane of Energy Saver system preference.

This policy can take effect dynamically at the next group policy refresh interval.

Set computer sleep time

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Energy Saver > Set computer sleep time

Description

Specify the number of minutes of inactivity to allow before automatically putting a computer into the sleep mode.

If you enable this group policy, the period of inactivity you specify applies only when the computer is using its power adapter. If the computer is inactive for the number of minutes you specify, it is put in sleep mode.

• • • • •

Enabling this group policy is the same as selecting a time using the **Put the computer to sleep when it is inactive for** slider in the Sleep pane of Energy Saver system preference.

To prevent the computer from ever going into sleep mode, enter 0 for the number of minutes, or disable the policy.

This policy can take effect dynamically at the next group policy refresh interval.

Set display sleep time

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Energy Saver > Set display sleep time

Description

Specify the number of minutes of inactivity to allow before automatically putting the display into the sleep mode.

If you enable this group policy, the period of inactivity you specify applies when the computer is using its power adapter. If the computer is inactive for the number of minutes you specify, the display is put in sleep mode.

Enabling this group policy is the same as selecting a time using the **Put the display to sleep when it is inactive for** slider in the Sleep pane of Energy Saver system preference.

To prevent the display from ever going into sleep mode, enter 0 for the number of minutes, or disable the policy.

This policy can take effect dynamically at the next group policy refresh interval.

Wake when the modem detects a ring

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Energy Saver > Wake when the modem detects a ring

Description

Automatically take a computer out of sleep mode when the modem detects a ring. This group policy allows a computer that has been put to sleep to remain available to answer the modem.

This policy can take effect dynamically at the next group policy refresh interval.

Wake for Ethernet network administrator access

Automatically take a computer out of sleep mode when the computer receives a Wake-on-LAN packet from an administrator. This group policy allows a computer that has been put to sleep to remain available to network administrator access.

Enabling this group policy is the same as selecting the **Wake for Ethernet network administrator access** option in the Options pane of Energy Saver system preference.

This policy can take effect dynamically at the next group policy refresh interval.

Scheduled events

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Energy Saver > Scheduled events

Description

To configure sleep/shutdown times and startup times, open the Scheduled events folder (**Computer Configuration Policies > Centrify Settings > Mac OS X Settings > EnergySaver > Scheduled events**).

Set machine sleep/shutdown time

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Energy Saver > Scheduled events > Set machine sleep/shutdown time

Description

Specify a time to shut down or put the computer to sleep.

Enabling this group policy is the same as selecting the **Schedule** button in the Energy Saver system preference, then specifying times and days to shut down or put the computer to sleep.

After enabling this policy, specify values for the following:

- **Action:** Select **sleep** or **shutdown**
- **Set machine sleep/shutdown time:** Enter a time in the format HH:mm using a 24 hour clock; for example, to shut down or put the computer to sleep at 10:05 P.M:
22:05
- **Sleep/shutdown machine on every:** Select the days of the week on which to shut down or sleep the computer at the specified time. All days are selected by default.

This policy can take effect dynamically at the next group policy refresh interval.

Set machine startup time

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Energy Saver > Scheduled events > Set machine startup time

Description

Specify a time to start up the computer.

Enabling this group policy is the same as selecting the **Schedule** button in the Energy Saver system preference, then specifying times and days to start up the computer.

After enabling this policy, specify values for the following:

- **Set machine startup time:** Enter a time in the format HH:mm using a 24 hour clock; for example, to start up the computer at 7:55 A.M.:
7 : 55
- **Start machine on every:** Select the days of the week on which to start the computer at the specified time. All days are selected by default.

This policy can take effect dynamically at the next group policy refresh interval.

Firewall

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Firewall

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Firewall** settings to manage the firewall options on Mac computers.

Enabling the Centrify firewall group policies is the same as setting options from **System Preferences > Security > Firewall**.

Note With the Centrify Firewall Group Policies, you can allow all incoming connections, or limit connections to the specified services and applications. You cannot block all connections:

In addition group policies are available for the Advanced firewall settings, Enable Firewall Logging, and Enable Stealth Mode.

Enable firewall

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Firewall > Enable firewall

Description

Prevent incoming network communication to all services and ports other than those explicitly enabled for the services specified in the Services pane of the Sharing system preferences.

This group policy turns on default firewall protection.

- Block all incoming connections:
Block all incoming connections except those required for basic Internet services, such as DHCP, Bonjour, and IPSec.
- Automatically allow signed software to receive incoming connections:
Allows software signed by a valid certificate authority to provide services accessed from the network. This setting will not take effect if **Block all incoming connections** is selected.

This policy takes effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable iChat

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Firewall > Enable iChat

Description

On Mac OS X Servers, enabling this policy has no effect. If the firewall is enabled, the iChat service is not allowed through the firewall.

If the firewall is enabled, enabling this group policy is the same as clicking the **On** checkbox to allow communication through the firewall for iChat Bonjour. If you do not enable this group policy, traffic for iChat Bonjour will be blocked from the local computer.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable iPhoto Sharing

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Firewall > Enable iPhoto Sharing

Description

On Mac OS X Servers, enabling this policy has no effect. If the firewall is enabled, the iPhoto Sharing service is not allowed through the firewall.

If the firewall is enabled, enabling this group policy is the same as clicking the **On** checkbox to allow communication through the firewall for iPhoto Bonjour Sharing. If you do not enable this group policy, traffic for iPhoto Bonjour Sharing will be blocked from the local computer. Users will be able to access iPhoto collections on other computers, but the local computer cannot be used to serve any iPhoto collections.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable iTunes Music Sharing

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Firewall > Enable iTunes Music Sharing

Description

Enabling this group policy is the same as clicking the **On** checkbox to allow communication through the firewall for iTunes Music Sharing.

On Mac OS X Servers, enabling this policy has no effect. If the firewall is enabled, the iTunes Music Sharing service is not allowed through the firewall.

If you do not enable this group policy, traffic for iTunes Music Sharing will be blocked from the local computer. Users will be able to access iTunes collections on other computers, but the local computer cannot be used to serve any iTunes collections.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable Network Time

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Firewall > Enable network time

Description

On Mac OS X Servers, enabling this policy has no effect. If the firewall is enabled, the Network Time service is not allowed through the firewall.

• • • • •

If the firewall is enabled, enabling this group policy is the same as clicking the **On** checkbox to allow communication through the firewall for Network Time. If you do not enable this group policy, traffic from the Network Time service will be blocked.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Block UDP Traffic

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Firewall > Block UDP traffic

Description

Enabling this group policy is the same as clicking the **Block UDP Traffic** checkbox in the Advanced firewall settings.

This group policy does not block UDP communications that are related to requests initiated on the local computer.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable Firewall Logging

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Firewall > Enable firewall logging

Description

Log information about firewall activity, including all of the sources, destinations, and access attempts that are blocked by the firewall. The activity is recorded in the `secure.log` file on the local computer.

Enabling this group policy is the same as clicking the **System Preferences > Security > Firewall** then clicking **Enable Firewall Logging** in the Advanced firewall settings.

On Mac OS X Servers, enabling this policy has no effect.

This policy takes effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable Stealth Mode

Prevent uninvited traffic from receiving a response from the local computer.

Enabling this group policy is the same as clicking the **System Preferences > Security > Firewall** then clicking **Enable Stealth Mode** in the Advanced firewall settings.

If you enable this group policy, the local computer will not respond to any network requests, including ping requests. Because the computer will not reply to ping requests, using this policy may prevent you from using network diagnostic tools that require a response from the local computer.

On Mac OS X Servers, enabling this policy has no effect.

This policy takes effect dynamically at the next group policy refresh interval without rebooting the computer.

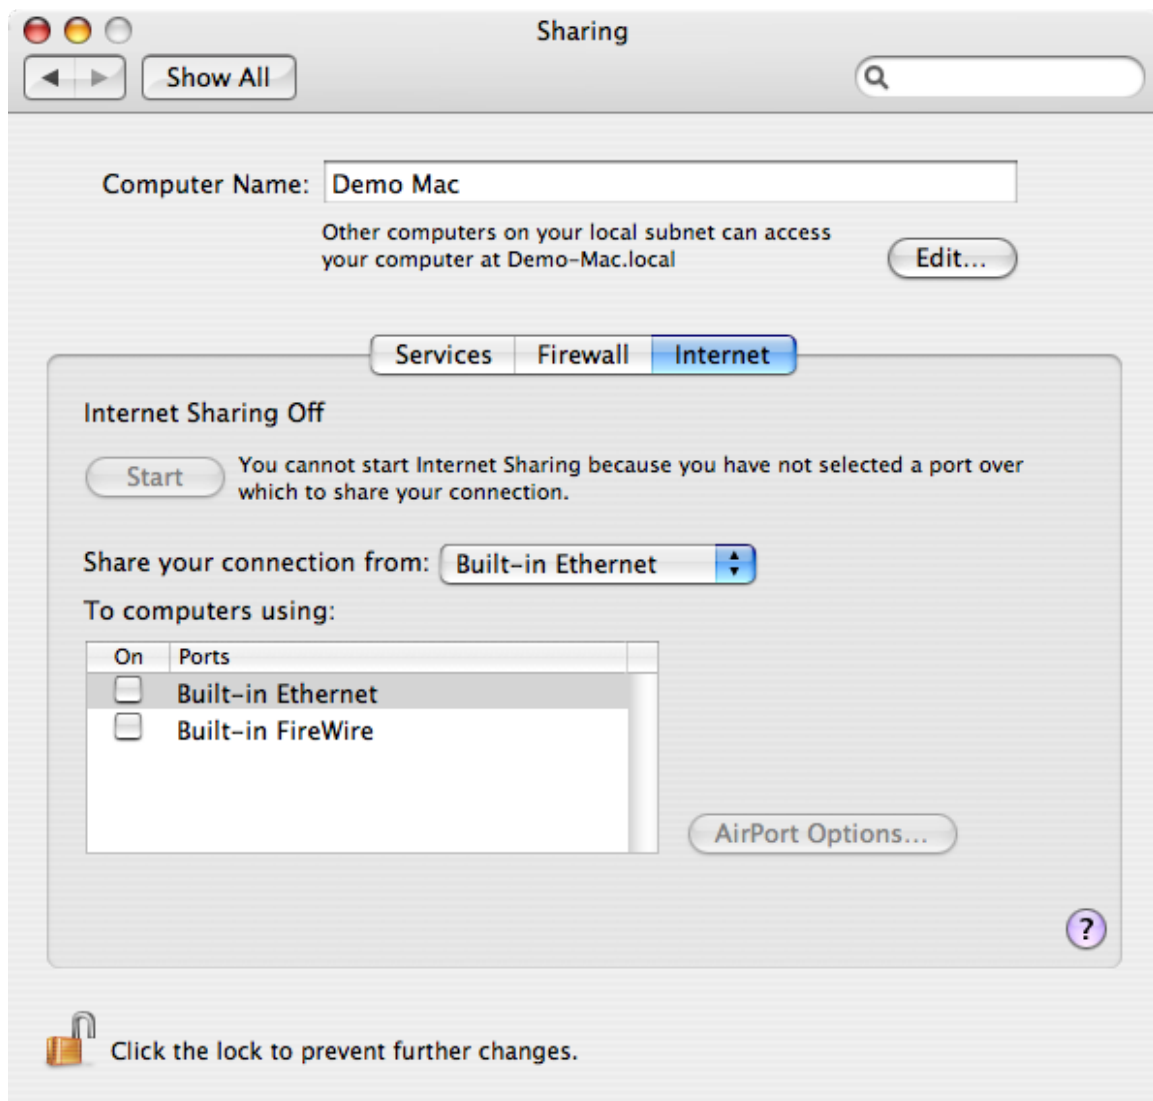

Internet Sharing

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Internet Sharing

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Internet Sharing** group policy to prevent any kind of Internet sharing on the local computer. This group policy can only be used to prevent Internet sharing. Although this group policy corresponds to a setting on the Internet pane of the Sharing () system preference, you can not use it to start Internet sharing, configure the shared connection, or set any other options. For example:

Disallow all Internet Sharing

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Internet Sharing > Disallow all Internet Sharing

Description

Prevent any kind of Internet sharing on the local computer. Enabling this group policy is the same as clicking **Stop** to prevent other computers from sharing an Internet connection on a local computer in the Internet pane of the Sharing system preference.

For this group policy, clicking Disabled or Not Configured has no effect. If you have previously Enabled the group policy, Internet sharing will remain off until you manually start it on the local computer.

Once enabled, this group policy takes effect when users log out and log back in, or dynamically at the next group policy refresh interval without rebooting the computer.

Network

Path

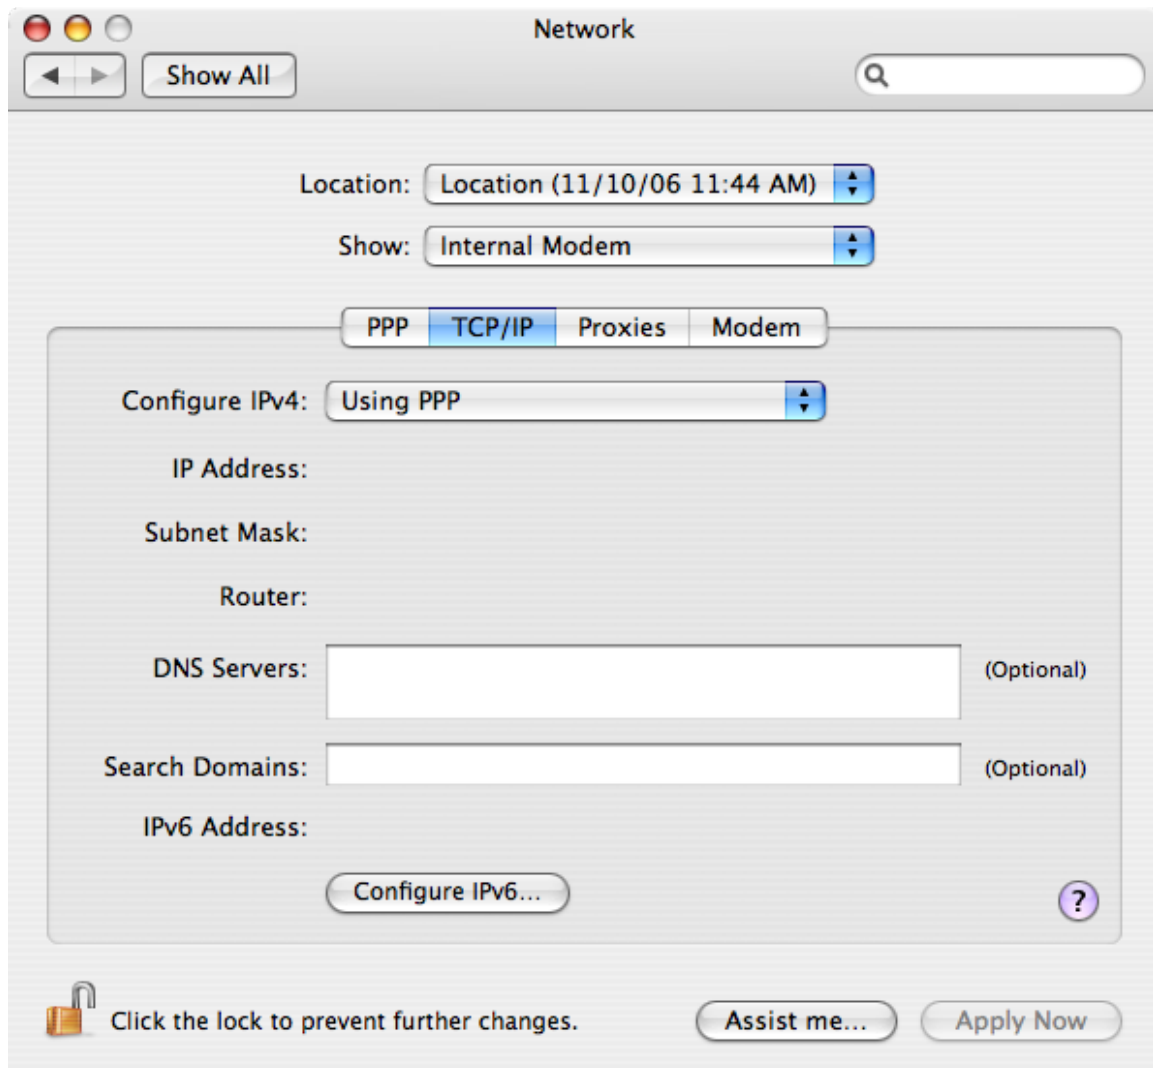

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network** settings to manage DNS search requests and proxy settings. These group policies correspond to settings in the TCP/IP and

.....

Proxies panes of the Network () system preference on Mac computers. For example:

Legacy location settings

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Legacy location settings

Description

Use **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Legacy location settings** to configure network settings for the Automatic network location.

Adjust list of DNS servers

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Legacy location settings > Adjust list of DNS servers

Description

Control the list of DNS servers when performing DNS lookups.

To use this policy, click **Enabled**, then click **Add**, type the IP address for a DNS server, then click **OK** to add the server to the list of DNS servers. Add as many servers as you want in this manner. When you are finished adding the servers, click **OK** to close the dialog box.

At any time while the policy is enabled, you can select an address in the list and click **Edit** to change the address, or **Remove** to remove it as a DNS server.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Adjust list of searched domains

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Legacy location settings > Adjust list of searched domains

Description

Control the list of domains to search when performing DNS lookups.

To use this policy, click **Enabled**, then click **Add**, type a domain name, then click **OK** to add the domain to the list of domains to search. Add as many domains as you want in this manner. When you are finished adding the domains to search, click **OK** to close the dialog box.

At any time while the policy is enabled, you can select a domain in the list and click **Edit** to change the name, or **Remove** to remove it as a domain to be searched.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Configure Proxies

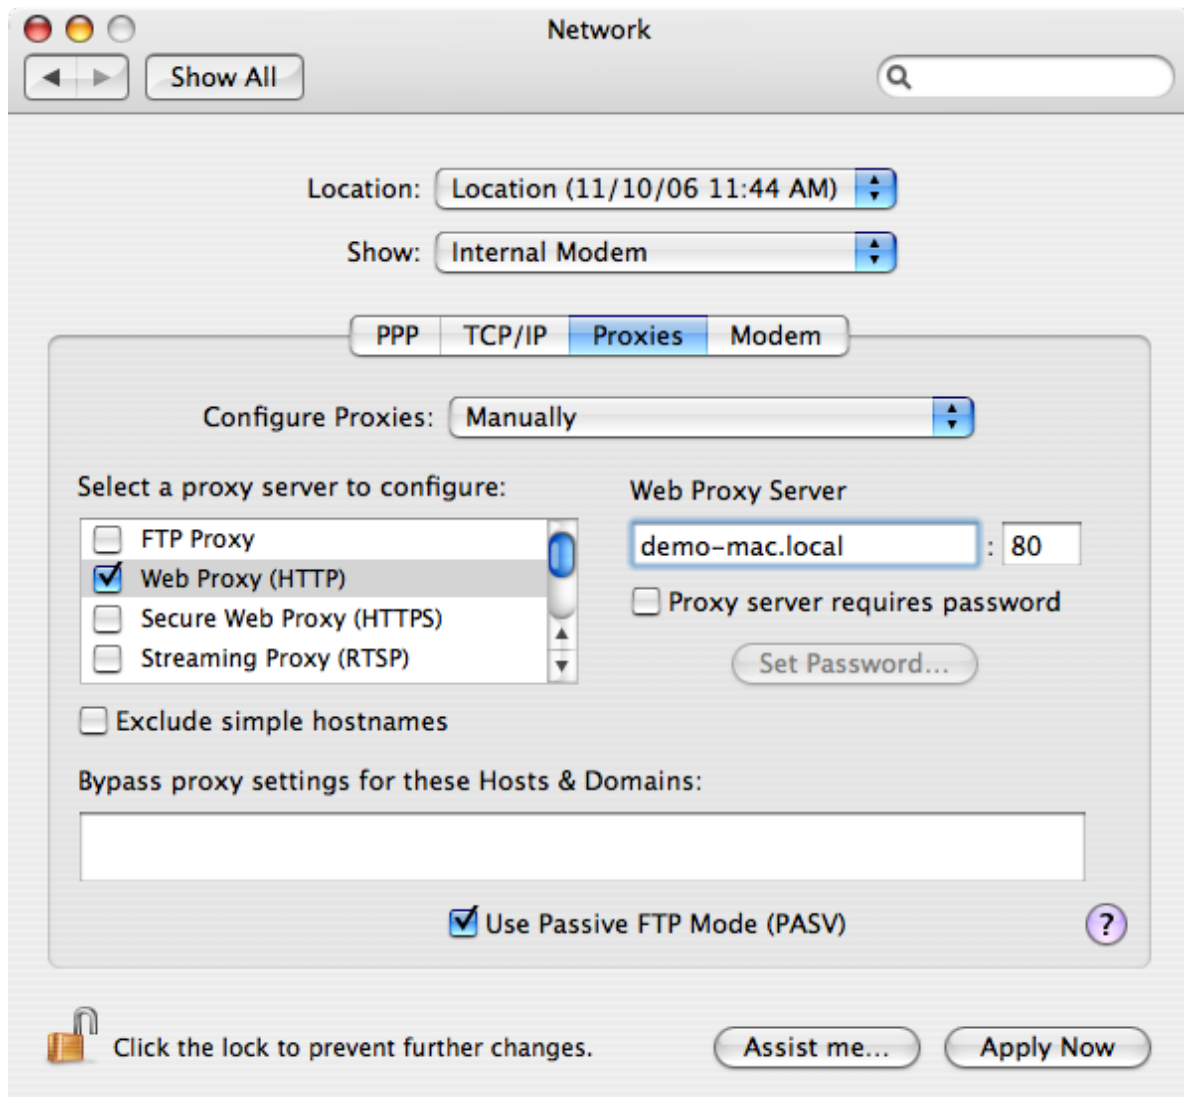

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Legacy location settings > Configure Proxies

Description

Configure proxy servers to provide access to services through a firewall.

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Configure Proxies** settings to manage settings on the Proxies panes of the Network system preference. For example:

These group policies enable you to configure the host names (or IP addresses) and port numbers for the computers providing specific services, such as File Transfer Protocol (ftp), Hypertext Transfer Protocol (http), and HTTP over Secure Sockets Layer (https), through a firewall. A proxy server is a computer on a local network that acts as an intermediary between computer users and the Internet to ensure the security and administrative control of the network.

Enable Proxies

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Legacy location settings > Configure Proxies > Enable Proxies

Description

Configure the host name (or IP address) and port number for the computers providing specific services. Within this category, you can enable the following proxy servers:

- Use the **Enable FTP Proxy** policy to configure the host name and port number for the FTP proxy server (FTP protocol).
- Use the **Enable Web Proxy** policy to configure the host name and port number for the Web proxy server (HTTP protocol).
- Use the **Enable Secure Web Proxy** policy to configure the host name and port number for the Secure Web proxy server (HTTPS protocol).
- Use the **Enable Streaming Proxy** policy to configure the host name and port number for the Streaming proxy server (RTSP protocol).
- Use the **Enable SOCKS Proxy** policy to configure the host name and port number for the Streaming proxy server (SOCKS protocol).
- Use the **Enable Gopher Proxy** policy to configure the host name and port number for the Gopher proxy server.
- Use the **Enable Streaming Proxy** policy to configure the host name and port number for the Streaming proxy server (RTSP protocol).
- Use the **Enable Proxies using a PAC file** policy to configure proxy servers from a proxy configuration file.

These policies can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Exclude simple hostnames

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Legacy location settings > Configure Proxies > Exclude simple hostnames

Description

Prevent requests to unqualified host names from using proxy servers. If you enable this policy, users can enter unqualified host names to contact servers directly rather than through a proxy.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Use Passive FTP Mode (PASV)

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Legacy location settings > Configure Proxies > Use Passive FTP Mode (PASV)

Description

Use the FTP passive mode (PASV) to access Internet sites when computers are protected by a firewall.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Bypass Proxy settings for these Hosts & Domains

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Legacy location settings > Configure Proxies > Bypass Proxy settings for these Hosts & Domains

Description

Specify fully-qualified host names and domains for which you want to bypass proxy settings.

You should use this policy to define the hosts or domains that should never be contacted by proxy.

To use this policy, click **Enabled**, then click **Add**, type a host or domain name, and click **OK** to add the entry to the Show Contents list.

Each host or domain should be listed as a separate line in the Hosts and Domains list. For each host or domain, click **Add**, type the host or domain name, and click **OK** to add the host or domain as a new entry in the list. When you are finished adding items to the list, click **OK** to close the policy dialog box.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Location 1 and Location 2

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Location 1

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Location 2

Description

Use **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Location 1** to configure network settings for an additional network location. The group policies in Location 2 are identical, and allow you to configure network settings for another network location.

Adjust list of DNS servers

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Location 1/Location 2 > Adjust list of DNS servers

Description

Control the list of DNS servers when performing DNS lookups.

To use this policy, click **Enabled**, then click **Add**, type the IP address for a DNS server, then click **OK** to add the server to the list of DNS servers. Add as many servers as you want in this manner. When you are finished adding the servers, click **OK** to close the dialog box.

At any time while the policy is enabled, you can select an address in the list and click **Edit** to change the address, or **Remove** to remove it as a DNS server.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Adjust list of searched domains

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Location 1/Location 2 > Adjust list of searched domains

Description

Control the list of domains to search when performing DNS lookups.

To use this policy, click **Enabled**, then click **Add**, type a domain name, then click **OK** to add the domain to the list of domains to search. Add as many domains as you want in this manner. When you are finished adding the domains to search, click **OK** to close the dialog box.

At any time while the policy is enabled, you can select a domain in the list and click **Edit** to change the name, or **Remove** to remove it as a domain to be searched.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable network location

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Location 1/Location 2 > Enable network location

Description

Enable all network location settings under the current location category and set its location name. This policy must be enabled to apply settings in this location category (for example, Location1).

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Configure Proxies

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Location 1/Location 2 > Configure Proxies

Description

Configure proxy servers to provide access to services through a firewall. The group policies in this folder are the same as the ones in Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Network > Legacy Location settings > Configure Proxies. Refer to [Configure Proxies](#) for more information.

Remote Management

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Remote Management

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Remote Management** settings to control Apple Remote Desktop access for zone users. You can use these group policies to give Active Directory group members permission to remotely control Mac computers without physically having to activate the Apple Remote Desktop on the remote Mac computer.

The Remote Management group policies correspond to the **Manage > Change Client Settings** options in Apple Remote Desktop and are similar to

● ● ● ● ● ●

● ● ● ● ● ●

● ● ● ● ● ●

● ● ● ● ● ●

● ● ● ● ● ●

● ● ● ● ● ●

● ● ● ● ● ●

● ● ● ● ● ●

.....

Note Creating UNIX profiles with these group names displays a warning message because the names are longer than 8 characters. You can safely ignore this warning message.

Enabling this policy allows users in the following groups to manage Mac computers through Apple Remote Desktop:

- `ard_admin` gives all members of the group the ability to remotely control the computer desktop.
- `ard_reports` gives all members of the group the ability to remotely generate reports on the computer.
- `ard_manage` gives all members of the group the ability to manage the computer using Apple Remote Desktop. Users in this group can perform the following tasks by using Apple Remote Desktop:
 - Generate reports
 - Open and quit applications
 - Change settings
 - Copy Items
 - Delete and replace items
 - Send text messages
 - Restart and shut down
- `ard_interact` gives all members of the group the ability to interactively observe or control the computer using Apple Remote Desktop.

Users in this group can perform the following tasks by using Apple Remote Desktop:

- Send text messages
- Observe
- Control

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

See [Setting up local and remote administrative privileges](#) for information on how to use this group policy with the [Map zone groups to local admin group](#) policy to enable both local and remote administrative access for the same group of users.

Scripts (Login/Logout)

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Scripts (Login/Logout)

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Scripts (Login/Logout) > Specify multiple login scripts** group policy to deploy login scripts that run when an Active Directory or local user logs on. When you use this group policy, the login scripts are stored in the Active Directory domain's system volume (sysvol) and transferred to the Mac computer when the group policies are applied. Login scripts are useful for performing common tasks such as mounting and un-mounting shares

This policy is also available as a user policy. If you specify scripts using both the computer and user policies, the computer scripts are executed first.

Specify multiple login scripts

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Scripts (Login/Logout) > Specify multiple login scripts

Description

Specify the names of one or more login scripts to execute when an AD or local user logs on. The scripts you specify run simultaneously in no particular order.

Before enabling this policy, you should create the scripts and copy them to the system volume (sysvol) on the domain controller. By default, the login

.....

scripts are stored in the system volume (SYSVOL) on the domain controller in the directory:

```
\\domain\SYSVOL\domain\Scripts
\scriptname1
\scriptname2
...
```

After enabling this policy, click **Add** and enter the following information:

- **Script:** The name of the script and an optional path, which are relative to `\\domain\SYSVOL\domain\scripts\`.

For example, if the domain name is `ajax.org` and you enter a script name of `start.sh`, the script that gets executed on the domain controller is:

```
\\ajax.org\SYSVOL\ajax.org\Scripts\mlogin.sh
```

You can specify additional relative directories in the path, if needed; for example, if you type `sub\mlogin.sh`, the file that gets executed is:

```
\\ajax.org\SYSVOL\ajax.org\Scripts\sub\mlogin.sh
```

- **Parameters:** An optional set of arguments to pass to the script. These arguments are interpreted the same way as in a UNIX shell; that is, space is a delimiter, and backslash is an escape character. You can also use `$USER` to represent the current user's name. For example:

```
arg1 arg2 arg3
arg1 'a r g 2' arg3
```

Note Be certain authenticated users have permission to read these files so the scripts can run when they log in.

Once this group policy is enabled, it takes effect when users log out and log back in.

Scripts (LaunchDaemons)

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Scripts (launchDaemons)

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Scripts (LaunchDaemons) > Specify multiple LaunchDaemon scripts** group policy to deploy scripts that run when `launchd` starts (system boot up). When you use this group policy, the LaunchDaemon scripts are stored in the Active Directory domain's system volume (`sysvol`) and transferred to the Mac computer when the group policies are applied. Using LaunchDaemons to run scripts allows you to run the scripts as root, where the **Specify multiple login scripts** group policy can only be run as the logged in user.

Refer to the following Apple resources to learn more about Launch Daemons and Agents.

- <https://developer.apple.com/library/content/documentation/MacOSX/Conceptual/BPSystemStartup/Chapters/CreatingLaunchdJobs.html>
- https://developer.apple.com/library/content/technotes/tn2083/_index.html#//apple_ref/doc/uid/DTS10003794

Specify multiple LaunchDaemon scripts

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Scripts (launchDaemons) > Specify multiple LaunchDaemon scripts

Description

Enable this group policy to specify multiple scripts to run automatically when `launchd` starts (system boot up).

The scripts you specify run simultaneously in no particular order.

Before enabling this policy, you should create the scripts and copy them to the system volume (`sysvol`) on the domain controller. By default, the

.....

LaunchDaemon scripts are stored in the system volume (SYSVOL) on the domain controller in the directory:

```
\\domain\SYSVOL\domain\Scripts
\scriptname1
\scriptname2
...
```

After enabling this policy, click **Add** and enter the following information:

- **Script:** The name of the script and an optional path, which are relative to `\\domain\SYSVOL\domain\scripts\`.

For example, if the domain name is `ajax.org` and you enter a script name of `startup.sh`, the script that gets executed on the domain controller is:

```
\\ajax.org\SYSVOL\ajax.org\Scripts\startup.sh
```

You can specify additional relative directories in the path, if needed; for example, if you type `sub\mlogin.sh`, the file that gets executed is:

```
\\ajax.org\SYSVOL\ajax.org\Scripts\sub\startup.sh
```

- **Parameters:** An optional set of arguments to pass to the script. These arguments are interpreted the same way as in a UNIX shell; that is, space is a delimiter, and backslash is an escape character. For example:

```
arg1 arg2 arg3
arg1 'a r g 2' arg3
```

Security & Privacy

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy

Description

Use the Centrify group policies found in **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy** to manage

the Keychain, public and private keys, and the options from the Security & Privacy () system preference on Mac OS X computers.

Auto Generate New Login Keychain

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > Auto Generate New Login Keychain

Description

Use this policy to automatically generate a new login keychain if a user's keychain password does not match the password they used to successfully login, resulting in the message "the system was unable to unlock your login keychain".

This commonly occurs if someone has changed their account password on another system.

If this policy is enabled, a new keychain will be generated when a password sync issue is discovered. This new keychain will be set as the default login keychain and the previous keychain will be moved to a backup.

Centrify recommends disabling this policy if you plan to use [Enable Keychain synchronization](#).

This policy is disabled by default.

Certificate validation method

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Certificate validation method

Description

Specify the certificate validation method to use for the Mac computer.

Note This group policy has no effect on the “Keychain Access > Preferences > Certificates” settings. Keychain Access > Preferences are per-user settings, which are not used by a Mac computer during login. This group policy changes Centrify SmartCardTool > Revocation settings, which represent the system settings used by a Mac computer during login.

This policy allows you to choose either one, or both of the two common methods for verifying the validity of a certificate:

- **Certificate Revocation List:** Use a certificate revocation list (CRL) from a revocation server.
- **Online Certificate Status Protocol:** Use an online certificate status protocol (OCSP) responder to validate certificates.
If you select this option, you can specify a local responder to override the one provided in the certificates.

For each validation option, you can select one of the following settings:

- **Off:** No revocation checking is performed.
- **Best attempt:** The certificate passes unless the server returns an indication of a bad certificate.
This setting is recommended for most environments.
- **Require if cert indicates:** If the URL to the revocation server is provided in the certificate, this setting requires a successful connection to a revocation server as well as no indication of a bad certificate.

Specify this option only in a tightly controlled environment that guarantees the presence of a CRL server or OCSP responder. If a CRL server or OCSP responder is not available, SSL and S/MIME evaluations could hang or fail.

- **Require for all certs:** This setting requires successful validation of all certificates.

Use only in a tightly controlled environment that guarantees the presence of a CRL server or OCSP responder. If a CRL server or OCSP

responder is not available, SSL and S/MIME evaluations could hang or fail.

- **Local Responder:** If you choose to validate the certificate via OCSP, you can specify a local responder to override that provided in the certificates.
- **Priority:** The priority determines which method (OCSP or CRL) is attempted first.

If the first method chosen returns a successful validation, the second method is not attempted, unless you choose to require both.

Disable automatic login

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Disable automatic login

Description

Disable the automatic login setting. If you enable this group policy, it overrides the Login Options set in the General tab of the Security & Privacy system preference.

For this group policy, clicking Disabled or Not Configured has no effect.

Once enabled, this group policy takes effect when the computer is rebooted.

Disable Location Services

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Disable Location Services

Description

Disable the “Enable Location Services” setting. If you enable this group policy, it overrides the Enable Location Services setting in the Privacy tab of the Security & Privacy system preference.

For this group policy, clicking Disabled or Not Configured has no effect.

Once enabled, this group policy takes effect at the next group policy refresh interval.

Disable smart card UPN mapping

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Disable smart card UPN mapping

Description

Disable smart card UPN mapping. With UPN mapping enabled, inserting a smart card changes the login UI to welcome the UPN user identified in the UPN field on the PIV card, which prevents the use of multi-user Personal Identity Verification (PIV) cards.

This policy must be used in combination with the `smartcard.name.mapping` parameter to enable multi-user PIV cards on Mac devices. Refer to [Enabling support for multi-user PIV and multi-user smart cards](#) for more information.

Disable smart card PIN caching

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Disable smart card PIN caching

Description

This policy disables the default system behavior which allows for caching the smart card PIN for operations that come in close succession.

Enabling this policy ensures that when a smart card is enabled, all operations that require administrator authentication will require the smart card PIN.

By default, PIN caching is enabled for smart cards.

Enable smart card support

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Enable smart card support

Description

Enable users to logon with smart cards. If you enable this group policy, it adds smart card support to the authorization database on Mac computers that are linked to the group policy object.

This policy also creates a text file named `/etc/cacloginconfig.plist` on each computer. This configuration file directs the Mac smart card log-in to look for a user in Active Directory with a user principal name (UPN) that is the same as the NT Principal Name attribute in the smart card log-in certificate.

See [Configuring a Mac computer for smart card login](#) for details.

Select **Enable YubiKeys as a smart card** to enable using YubiKeys as a smart card. Enabling YubiKeys as a smart card installs Yubico's libccid to enable communication to the YubiKey using CCID protocol, allowing users to authenticate with a YubiKey PIV token. Unchecking this option does not remove Yubico's libccid from impacted computers.

If you later disable this policy, the smart card support strings are removed from the authorization database and the `/etc/cacloginconfig.plist` file is deleted. Changing this policy to Not configured does not remove the smart

• • • • •

card support strings nor remove the `plist` file. Once this policy is enabled, you must select Disabled to do this.

Once enabled, this policy takes effect dynamically at the next group policy refresh interval.

Once enabled, this group policy takes effect when the computer is rebooted.

Enable smart card support for sudo

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Enable smart card support for sudo

Description

This group policy configures sudo to require the smart card PIN for authentication instead of the user's password. The user must be configured in the `sudoers` file and a smart card corresponding to the user must be presented at the time sudo is run.

If the smart card keychain is unlocked when sudo is run, sudo will not prompt for the PIN for authentication.

Enable FileVault 2

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Enable FileVault 2

Description

This group policy allows you to select whether to use one institutional key for multiple Mac computers, or computer-specific (“personal”) keys.

To use one institutional key for multiple Mac computers, select **Use Institutional Recovery Key**. Then click **Select** to select the certificate that contains the FileVault master keychain that can unlock the encrypted disk. You must already have created a FileVault master keychain and exported the certificate for the master keychain to a Windows domain server before you perform this step.

To use computer-specific (“personal”) keys instead of one institutional key, leave **Use Institutional Recovery Key** unchecked. In this situation, a personal recovery key is created for the Mac computer and stored in the computer object in Active Directory. The key is created and sent to the computer object in Active Directory after the “Managed By” user logs in, logs out, and provides the user password.

This policy is available only for OS X 10.9 and later.

For complete instructions, see [Configuring FileVault 2](#).

Note Enabling this group policy does not immediately enable FileVault 2 protection on a Mac computer. FileVault 2 protection is enabled when the FileVault-enabled user (that is, the “Managed By” user) logs on to the computer. Disabling this group policy does not disable FileVault 2 protection — disabling FileVault 2 can only be done manually.

Once enabled, this group policy takes effect at the next group policy update interval or when you execute the `adgpupdate` command.

Enable Gatekeeper

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Enable Gatekeeper

Description

Enable the Gatekeeper feature, which controls access to the Mac App store. This policy overrides the “Allow applications downloaded from” setting on the General tab of the Security & Privacy system preference pane.

After enabling the policy, select one of the following options:

- **Mac App Store** Only allow installation of applications that have been downloaded from the Mac App store.
- **Mac App Store** and identified developers. Only allow installation of applications that have been downloaded from the Mac App Store or were created by Apple-sanctioned developers.
- **Anywhere** Allow installation of any applications.

Enable Keychain synchronization

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Enable Keychain synchronization

Description

This group policy controls whether to enable keychain synchronization, which syncs the login keychain to the login user’s AD password when a password change is detected.

Note Keychain synchronization is password-focused and should not be used in smart card environments.

Set the **Password change detection interval (minutes)** option to determine the time (in minutes) between checking for changed passwords. There is a random zero to five minute variance in the actual interval each device is checked for a changed password to maintain performance. As a result, the minimum interval is five minutes.

The default value is 30 minutes.

The **Store AD password in the login Keychain** option is used to streamline updates of the user's login Keychain password. If this option is enabled the Keychain Sync utility stores the user's AD password in the login keychain the next time the user logs in. If the password is changed after the policy is enabled but before the previous password is stored in the login keychain, the keychain sync application requests the previous password.

When this option is selected, the user's AD password is encrypted using a static AES256 key that is unique to that user and stored in the login Keychain as an application password. The key and password are added to the keychain using the [SecItemAdd](#) API. In addition, an Access Control List ensures that only the Keychain Sync utility can access the key used to encrypt and decrypt the password.

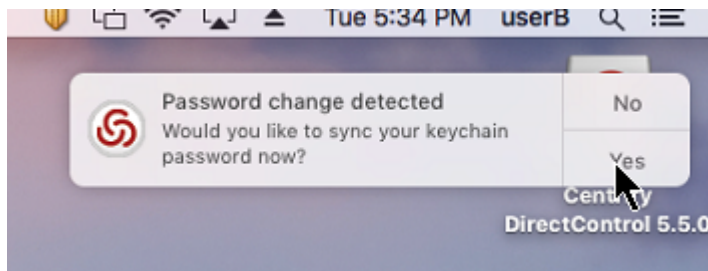

Centrify recommends disabling [Auto Generate New Login Keychain](#) before enabling this policy.

Please note the following limitations with the **Store AD Password in the login Keychain** option:

- This option only works on macOS 10.12 or later.
- The user's AD password is inaccessible when the login keychain is locked. The most common scenario that causes this is if a user's AD password is changed and the user logs out before syncing the keychain, then logs back in. When the user logs back in, the password check fails due to the new password, locking the login Keychain and preventing the Keychain Sync utility from accessing it.
- Password changes can only be detected when the machine is in connected mode.

[User experience when the AD password is already stored in the login Keychain.](#)

1. The login user receives a password change notification when his/her password is changed remotely.

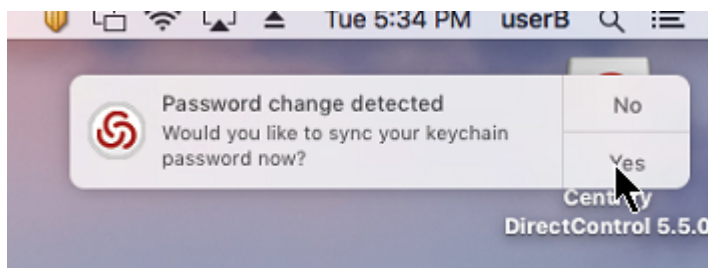

2. When the user clicks **Yes** on the notification, the Centrify Keychain Sync utility appears and asks for the current password to sync the keychain.

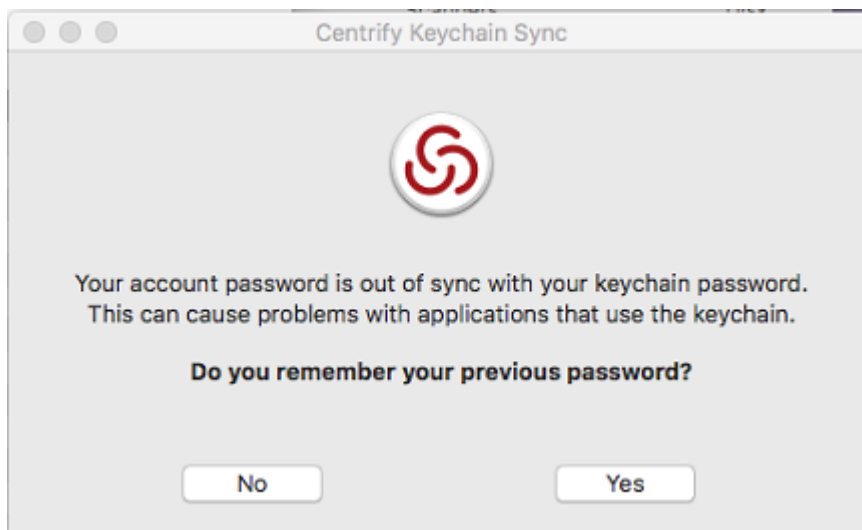

After entering the current password and clicking **OK**, the Keychain Sync utility syncs the login keychain with the new password.

User experience when the AD password is not yet stored in the login Keychain.

1. The login user receives a password change notification when his/her password is changed remotely.

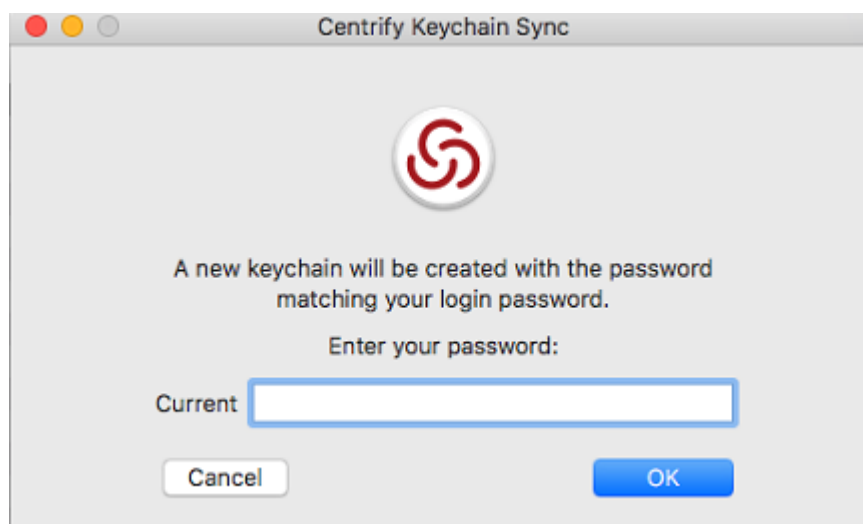

2. When the user clicks **Yes** on the notification, the Centrify Keychain Sync utility appears and asks if the user remembers the previous password.

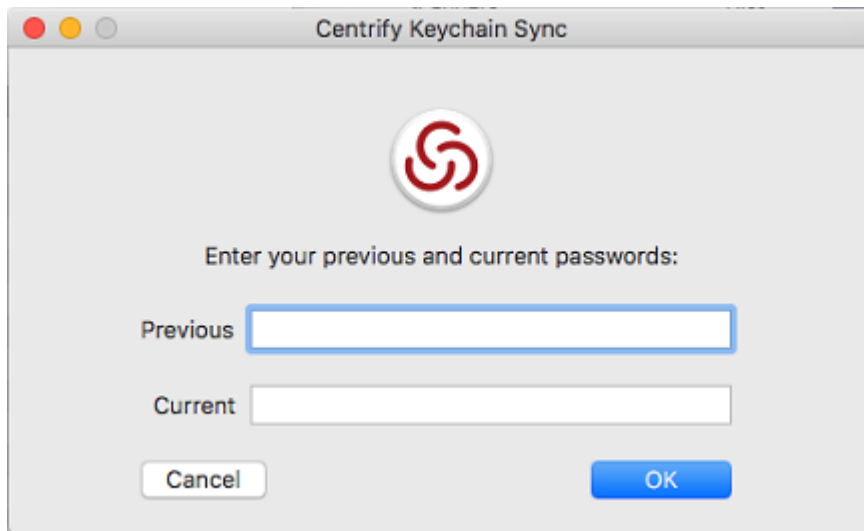

3. The user clicks **Yes** or **No**.

- If the user clicks **No**, the Keychain Sync utility creates a new login keychain.

- If the user clicks **Yes**, the Keychain Sync utility asks for the previous and current passwords.

After entering the previous and current passwords and clicking **OK**, the Keychain Sync utility syncs the login keychain with the new password.

Log out after number of minutes of inactivity

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Log out after number of minutes of inactivity

Description

Specify the number of minutes of inactivity to allow on a computer before automatically logging out the current user. The default value is 5 minutes.

Setting the value to less than 5 minutes disables automatic logout. If you plan to disable automatic logout, it is recommended that you set the value to 0 to preserve backward compatibility.

Note Disabling this policy does not disable automatic logout.

This policy takes effect when users log out and log back in after the next group policy refresh.

Require password to unlock each secure system preference

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Require password to unlock each secure system preference

Description

Lock sensitive system preferences to prevent users who aren't administrators from changing them. This group policy requires users to provide an administrator's password to unlock each secure system preference before they can make changes.

If you enable this policy, users must provide an administrator password to access any secure system preference. If the current user is logged on as an administrator and this policy is not configured or disabled, the user can access and change secure system preferences without providing the administrator password.

This policy can take effect dynamically at the next group policy refresh interval.

Require smart card login

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Require smart card login

Description

Require all users to log in with a smart card. When this policy is enabled, no users can log in to the computer simply with a user name and password, with

the exception of those you add to an exception group as explained below.

Note To require smart card login for a specific user rather than all users on the computer, in the user's Active Directory account properties, specify the option, **Smart card is required for interactive logon**.

The Enable smart card support policy must also be enabled in order for this policy to take effect.

Once enabled, this group policy takes effect when the computer is rebooted

Exception groups

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Exception groups

Description

Exception groups are Active Directory groups that you create, whose members are exempted from this option. Users in these groups can log in using their AD user name and password, if necessary. The purpose of creating exception groups is to allow users who regularly use a smart card for login, but don't have it with them, to temporarily log in with a user name and password.

You create a group in Active Directory and add the user accounts that will be able to log in to their computers without a smart card. After enabling the policy, click **Add** and enter the name of the group or click **Browse** and enter search criteria to find it. You can add multiple exception groups if you wish.

The computer must be in connected mode for any group membership changes to take effect immediately.

Note "Smart card is required for interactive logon" should be disabled in user account settings in order for the exception group to work.

A smart-card user who is a member of an exception group may see the following prompt at some point after logging in with an Active Directory user

name and password, "The system was unable to unlock your login keychain", because the login keychain is locked with the smartcard PIN and cannot be unlocked with a user name and password. If adding the user to the exception group is temporary, the user should click "**Continue Log In**" and enter the smartcard PIN when prompted with "Security wants to use the 'login' keychain."

Use secure virtual memory

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Use secure virtual memory

Description

Prevent passwords from being recoverable from virtual memory.

Any time a password is entered, it is possible for system to write that password in a block of memory that it dumps to a file in /var/vm, making the password recoverable.

Enabling this group policy ensures that the virtual memory /var/vm files are encrypted, preventing any passwords written there from being recovered.

This policy can take effect dynamically at the next group policy refresh interval.

Allow all applications to access the auto-enrollment private key(s)

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Public Key Policies > Allow all applications to access the auto-enrollment private key(s)

Description

Enabling this policy allows all applications to access the auto-enrollment private key(s) in the System keychain.

See [Configuring auto-enrollment](#) for more information about auto-enrollment keys.

Note This setting only applies to a new auto-enrollment private key(s); it will not update already imported auto-enrollment private key(s) that are in the System keychain.

Allow specific applications to access the auto-enrollment private key(s)

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Public Key Policies > Allow specific applications to use the auto-enrollment private key(s)

Description

Enabling this policy allows specified applications to access the auto-enrollment private key(s) in System keychain.

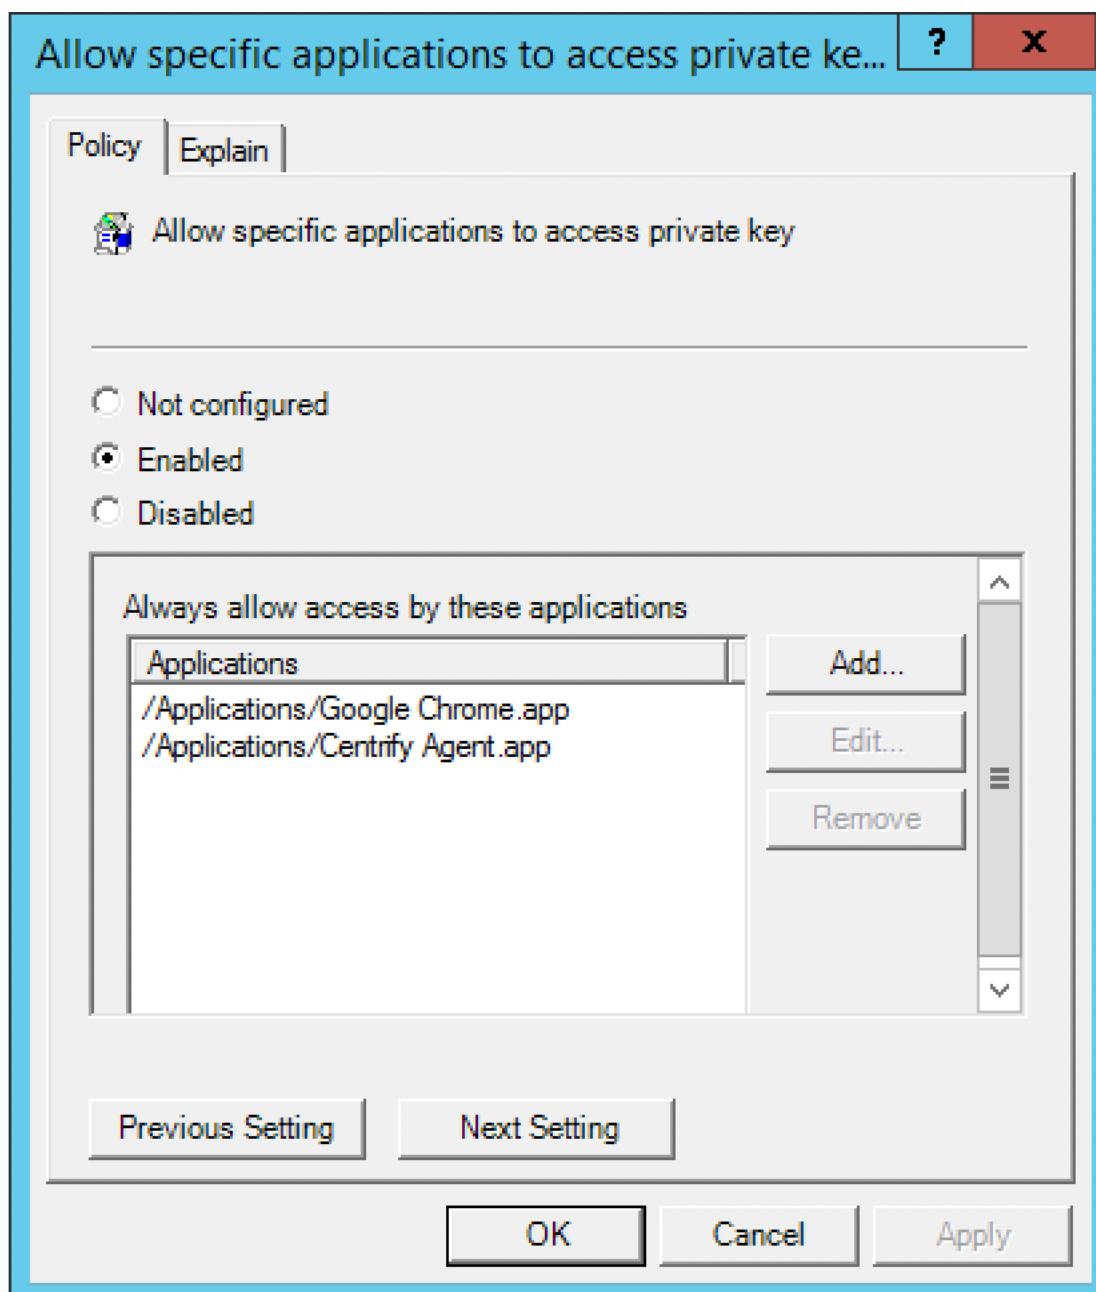

After you enable this policy, click **Add** to enter the path to the application you want to allow access to the auto-enrollment private key, then click **OK**. You can click **Add** again to add additional applications.

For example, to give Google Chrome and Centrify Agent access to the auto-enrollment private key, enter the application path for Google Chrome:

```
/Applications/Google Chrome.app
```

Click **OK**. Then click **Add** and enter the application path for Centrify Agent:

```
/Applications/Centrify Agent.app
```

After this group policy is enabled, the list of applications specified in the group policy are added to the access control list of the auto-enrollment private key in System keychain.

See [Configuring auto-enrollment](#) for more information about auto-enrollment keys.

Note This setting only applies to a new auto-enrollment private key. It does not change auto-enrolled private keys that are already in the keychain.

If the group policy [Allow all applications to access the auto-enrollment private key\(s\)](#) is enabled, this group policy will be ignored.

Do not allow the private key(s) to be extractable

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Public Key Policies > Do not allow private key(s) to be extractable

Description

Enabling this policy prevents exporting the auto-enrollment private key(s).

Note This setting only applies to a new auto-enrollment private key. It does not change the auto-enrolled private key(s) that are already in the keychain.

Store the private and public key(s) only in the keychain

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Public Key Policies > Store the private and public key(s) only in the keychain

Description

Enable this group policy to store the auto-enrollment key(s) only in the keychain.

User certificate auto-enrollment always uses the Keychain and is not controlled by any Group Policy.

Note 802.1X profiles installed through the "Mac OSX Settings -> 802.1X Settings" Group Policies will no longer be signed if this GP is enabled before profiles are installed.

• • • • •

Services

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Services

Description

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Services** settings to manage access to the service options from the Sharing () system preference on Mac computers. These group policies correspond to the options displayed on the Services pane. For example:

Enable Personal File Sharing

Path

Computer Configuration > Policies > Centrifys Settings > Mac OS X Settings > Services > Enable Personal File Sharing

Description

Allow users on other Mac computers access to Public folders on the local computer. If you enable this group policy, all users can access files in the Public folder through the Apple File Sharing protocol. Users with appropriate

• • • • •

permission can also access other folders on the local computer if properly authenticated.

Enabling this group policy is the same as opening the Sharing system preference, selecting **File Sharing**, then clicking the **Options** button and selecting the **Share Files and Folders using AFP** option.

On Mac OS X Servers, enabling this policy has no effect.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable Windows Sharing

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Services > Enable Windows Sharing

Description

Allow users on Windows computers access to shared folders on the local computer through SMB/CIFS file shares.

Enabling this group policy is the same as opening the Sharing system preference, selecting **File Sharing**, then clicking the **Options** button and selecting the **Share Files and Folders using SMB** option.

On Mac OS X Servers, this policy has no effect.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable Personal Web Sharing

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Services > Enable Personal Web Sharing

Description

Allow users on other computers to view Web pages in each user's sites folder on the local computer.

Enabling this group policy is the same as opening the Sharing system preference and selecting the Web Sharing option.

On Mac OS X Servers, enabling this policy has no effect.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable Remote Login

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Services > Enable Remote Login

Description

Allow users on other computers to access this computer using SSH.

Enabling this group policy is the same as opening the Sharing system preference and selecting the Remote Login option.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable FTP Access

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Services > Enable FTP Access

Description

Allow users on other computers to exchange files with this computer using FTP applications.

Enabling this group policy is the same as opening the Sharing system preference, selecting **File Sharing**, then clicking the **Options** button and selecting the **Share Files and Folders using FTP** option.

On Mac OS X Servers enabling this policy has no effect.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable Apple Remote Desktop

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Services > Enable Apple Remote Desktop

Description

Allow others to access this computer using the Apple Remote Desktop program.

Enabling this group policy is the same as opening the Sharing system preference and selecting the Remote Management option.

If you enable this group policy, you can set the following access privileges:

• • • • •

- Allow guest users to request permission to control the screen
- Prevent VNC viewers from controlling the screen.

Because allowing VNC viewers to control the screen requires setting a password to take control of the screen and this behavior presents a potential security issue, this group policy can only be used to disallow VNC access.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable Remote Apple Events

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Services > Enable Remote Apple Events

Description

Allow applications on other Mac computers to send Apple Events to the local computer.

Enabling this group policy is the same as opening the Sharing system preference and selecting the Remote Apple Events option.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable Printer Sharing

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Services > Enable Printer Sharing

Description

Allow other people to use printers connected to the local computer.

Enabling this group policy is the same as opening the Sharing system preference and selecting the Printer Sharing option.

On Mac OS X Servers, enabling this policy has no effect.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Enable Xgrid

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Services > Enable Xgrid

Description

Allow clustered Mac OS Xgrid controllers to distribute tasks to the local computer for completion.

Enabling this group policy is the same as opening the Sharing system preference and selecting the Xgrid Sharing option.

On Mac OS X Servers enabling this policy has no effect.

This policy can take effect dynamically at the next group policy refresh interval without rebooting the computer.

Software Update Settings

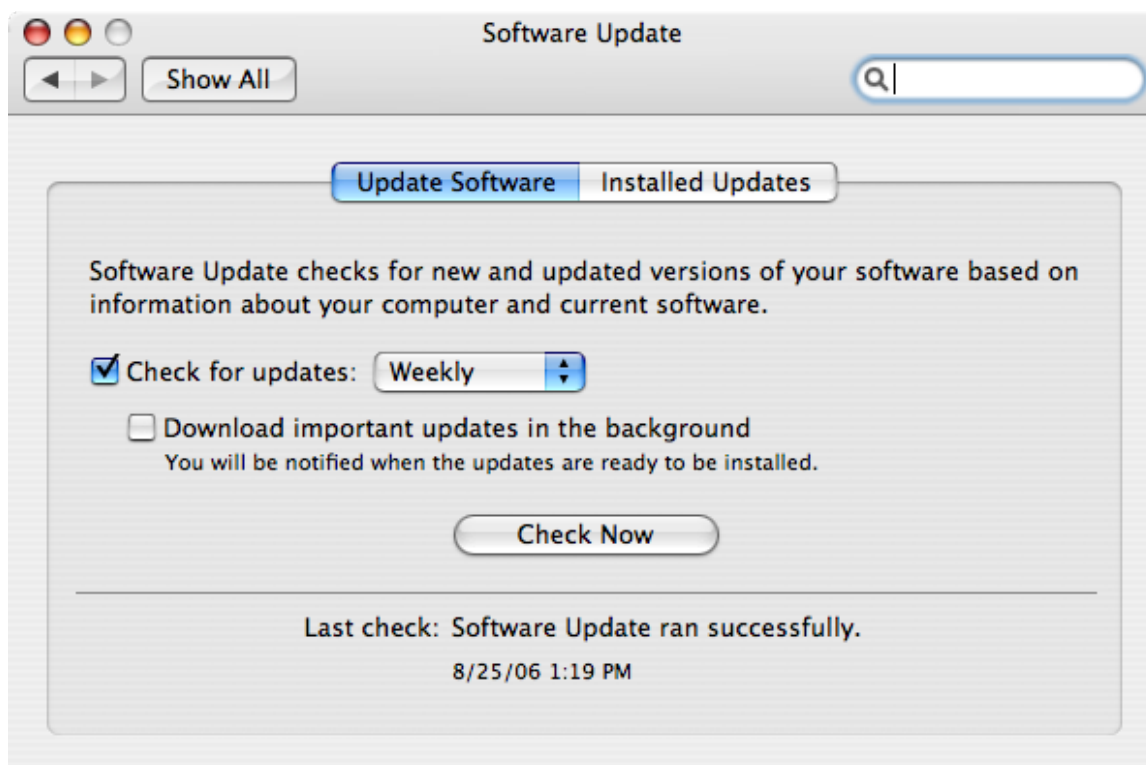

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Software Update Settings

Description

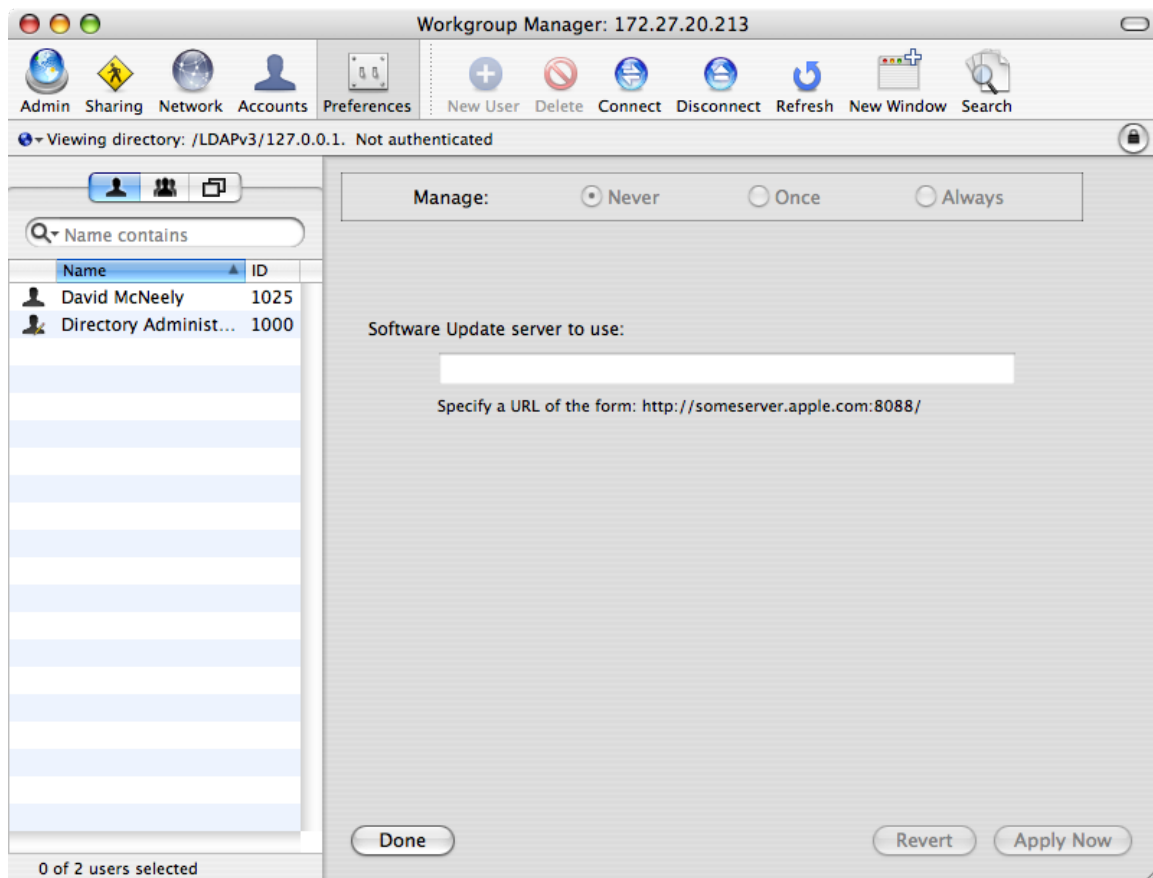

Use the **Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Software Update Settings** group policies to manage software updates. The group policies in this category enable you to set the interval for checking for software updates and to identify a specific server from which updates should be received.

These group policies correspond to settings you make using the Software Update () system preference on client Mac OS X computers and the Software Update preference in the Workgroup Manager on Mac OS X servers. For example, the interval for checking for software updates is typically configured Software Update system preference on client Mac computers:

.....

Note Identifying a software update server to use for downloading updates is configured on a Mac OS X server using the Software Update preference in the Workgroup Manager. For example:

The software update group policies are computer policies, applied as the root user, and apply to all users of the computer. Setting these group policies updates the plist files for individual users with the group policy parameters, such as update server URL, update interval, and so on. However, to prevent local users from using Software Update in System Preferences to manually set software update server parameters, an administrator should also limit access to the Software Update Preferences Pane by setting the group policy, **Limit items shown in System Preferences**, and then enabling the group policy, **Enable System Preferences Pane: System > Enable Software Update**.

Otherwise, you may see anomalous behavior. For example, a user can open Software Update and change parameters, such as disabling software updates (by deselecting Check for updates). If the user then re-enables software updates, the update server resets to the Apple software update server, not the server specified in the software update server group policy. However, at the next login, or at the next adgupdate period, the Server URL and other group parameters will be re-applied.

The Software Update Settings contain separate folders that allow you to specify a different update server for each operating system version that you are running. For example, if you have computers with different versions of OS X in your environment, you can specify a different update server for each one by enabling the Specify software update server policy in each of the version-specific folders. In order to do this you must enable Use version specific settings.

If you do not enable Use version specific settings, Legacy Settings are used instead. If you applied Software Update Settings to computers running previous versions of the product, those settings are in Legacy Settings, though you may update them if you wish.

Note The Automatically download and install software updates policy applies to all computers, regardless of version.

Automatically check for software updates (Legacy, Currently supported)

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Software Update Settings > Automatically check for software updates (Legacy, Currently supported)

Description

Note There are actually separate versions of this policy in version-specific folders.

Periodically check for updated versions of the software installed on the local computer and automatically download and install newer versions. You can configure the version-specific versions of this policy the same way you can configure the Software Update system preference for the corresponding operating system version.

This policy takes effect when users log out and log back in.

Use version specific settings

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Software Update Settings > Use version specific settings

Description

Enable the use of version-specific settings.

You can then set platform-specific preferences settings for each platform in your environment, which enables you to specify a different update server depending on the version of Mac OS X running on a computer. For example, if you have only 10.10 computers, you can enable this policy and then use Mac OS X 10.10 settings. If you have 10.10 and 10.9 computers, enable this policy, and then configure the version-specific policies as appropriate:

- Mac OS X 10.10 Settings
- Mac OS X 10.9 Settings

If this policy is disabled or not configured, Legacy Settings are used instead of version-specific settings. Likewise, Centrify versions prior to 4.4.2 always use Legacy Settings and ignore this policy setting.

If you configured Software Update Settings with a version of the product prior to 4.4.2, these settings are saved to Legacy Settings when you upgrade to the current Centrify version. You can keep or edit these settings as you wish.

Specify software update server (Legacy, Currently supported)

Path

Computer Configuration > Policies > Centrify Settings > Mac OS X Settings > Software Update Settings > Specify software update server (Legacy, Currently supported)

Description

Note There are actually separate versions of this policy in version-specific folders.

This enables you to specify a separate update server based on the version of the Mac OS X computer.

Type the URL that identifies the computer you are using as the software update server. It is recommended that you specify the hostname of the server rather than the IP address; for example:

```
http://myHost.local:8088
```

In addition, to ensure that DNS associates the hostname of the update server with the IP address, add a line such as the following to the `/etc/hosts` file:

```
192.168.2.79 myHost.local
```

where: `192.168.2.79` is the IP address of the update server and `myHost.local` is the hostname.

This policy can take effect dynamically at the next group policy refresh interval.

Setting user-based group policies

Centrify group policies allow administrators to extend the configuration management capabilities of Windows Group Policy Objects to managed Mac computers and to users who log on to Mac computers. This chapter describes the Mac group policies that can be applied to Mac users.

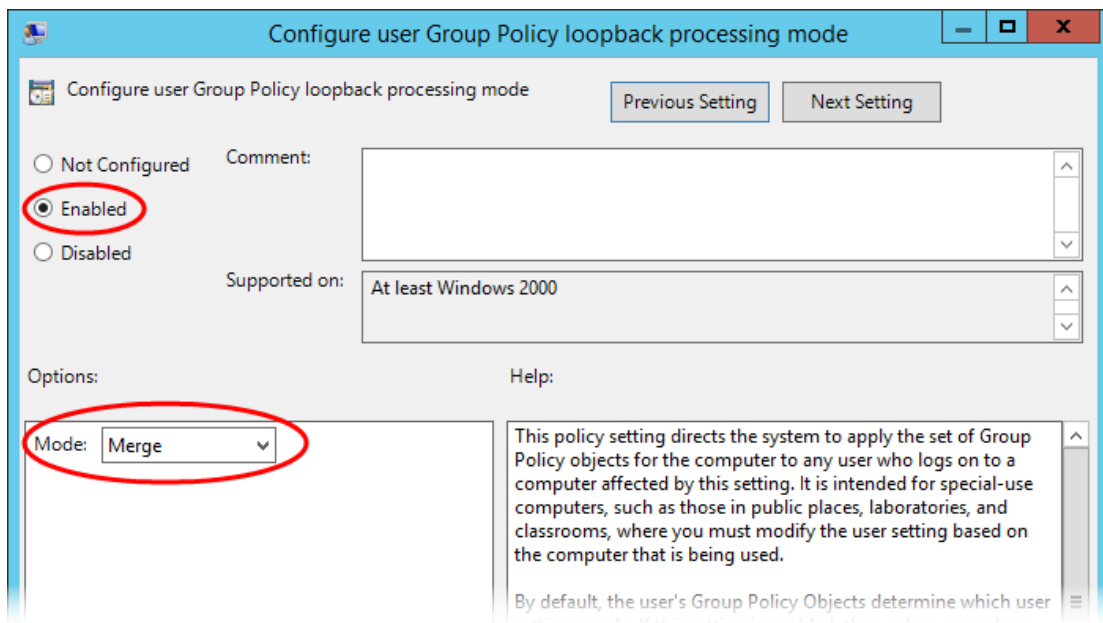

The user-based group policies are defined in the Centrify Mac administrative template (`centrify_mac_settings.xml`) and accessed from **User Configuration > Policies > Centrify Settings > Mac OS X Settings**.

Group policies are only applied to users and computers in the GPO's linked OU and any child OUs. If your users and computers are in different OUs (which is common), Centrify recommends using user Group Policy loopback processing to make sure user policies are applied to everyone who logs on to a Mac. This is a standard Microsoft Group Policy that applies to every user to the computer.

To implement user Group Policy loopback processing mode

1. In the Group Policy Management Editor, navigate to **Computer Configuration > Administrative Templates > System > Group Policy > Configure user Group Policy loopback processing mode**.

2. Enable the policy, set **Mode:** to **Merge**, then click **OK**.

See <https://technet.microsoft.com/en-us/library/cc978513.aspx> for more information about loopback processing.

See [Understanding group policies for Mac users and computers](#) for general information about how to use group policies to manage Mac settings and for information on how to install the group policy administrative templates.

Note For additional information about creating and using group policies and Group Policy Objects, see your Windows or Active Directory documentation. For more information about adding and using other Centrify group policies that are not specific to Mac computers and users, see the *Group Policy Guide*.

Setting user-based policies

This section describes user-based policies for Mac that you can set. The following table provides a summary of the group policies you can set for Mac users. These group policies are in the Centrify Mac administrative template (centrify_mac_settings.xml) and accessed from **User Configuration > Policies > Centrify Settings > Mac OS X Settings**.

Note Group policies are only applied to users and computers in the GPO's linked OU and any child OUs. Enable **Computer Configuration > Administrative Templates > System > Group Policy > Configure**

Note user **Group Policy loopback processing mode** in Merge mode to make sure user policies are applied to everyone who logs on to a Mac. See

Use this policy	To do this
802.1X Wireless Settings	<p>Create user profiles for wireless authentication.</p> <p>This group policy corresponds to 802.1X Options in the Networks system preference.</p>
Application Access Settings	<p>Control the specific applications users are either permitted to use or prohibited from using.</p> <p>These group policies correspond to Applications preferences set in the Workgroup Manager.</p>
Desktop Settings	<p>Control the desktop and screen saver options for users on Mac computers.</p> <p>These group policies correspond to settings in the Desktop & Screen Saver system preference.</p>
Dock Settings	<p>Control the look and operation of the Dock displayed on the user's desktop.</p> <p>These group policies correspond to Dock preferences set in the Workgroup Manager.</p>
Finder Settings	<p>Specify whether to use the standard Finder, or the Simple Finder, which restricts users to applications and folders in the Dock.</p>
Folder Redirection	<p>Redirect specified network home folders to the local computer to improve performance.</p>
Import Settings	<p>Specify plist files to import preferences from another computer.</p> <p>This group policy corresponds to the import plist functionality in Workgroup Manager.</p>
Login Settings	<p>Specify frequently used applications, folders, and server connections to open when a user logs in.</p> <p>This group policy corresponds to the login functionality in Workgroup Manager.</p>
Media Access Settings	<p>Control the specific media types users are either permitted to use or prohibited from using.</p> <p>These group policies correspond to Media Access preferences set in the Workgroup Manager.</p>

Use this policy	To do this
Mobility Settings	Control the synchronization rules applied for users access services from mobile devices. These group policies correspond to Mobility preferences set in the Workgroup Manager.
Scripts (Login/Logout)	Specify login and logout scripts that run when Active Directory users log on or log out.
Security & Privacy Settings	Control the secure login options for users on Mac computers. These group policies correspond to settings in the Security system preference.
System Preference Settings	Control the specific system preferences displayed for users. These group policies correspond to System Preferences set in the Workgroup Manager.

Note See [Setting user-based group policies](#) for additional detail.

802.1X Wireless Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > 802.1X Wireless Settings

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > 802.1X** settings to create profiles for wireless network authentication. The profiles you specify with these group policies are created in the Network system preferences pane.

Specify User Profiles (Deprecated)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > 802.1X Wireless Settings > Specify User Profiles (Deprecated)

Description

Enable this policy to specify 802.1X User Profiles for wireless network authentication.

When using a user profile, a user will be prompted for username and password to authenticate to a wireless network after login.

To add a user profile

1. Enable the policy and click **Add** to enter the profile name and setting.
2. Type a name for the profile.
3. Type the setting using the following format:
 - Network;Security Type;Authentication Method, where each field is separated by a semi-colon (;).
 - Network is the wireless network name
 - Security type is one of 802.1X WEP, WPAEnterprise, WPA2 Enterprise
 - Authentication method is one or more of the following, separated by commas: TTLS, PEAP, TLS, EAP-FAST, LEAP, MD5

For example:

```
OFFICE1;WPA Enterprise;PEAP
```

```
OFFICE2;802.1X WEP;TTLS, PEAP
```

Set the **Automatically turn on Airport** option to automatically turn on AirPort device if this type of profile is specified. Otherwise, the status of the AirPort device will not change.

• • • • •

Once enabled, this policy takes effect dynamically at the next group policy refresh interval.

Application Access Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Application Access Settings

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Application Access Settings** group policies to manage the applications Mac users are allowed to open or prevented from opening.

These group policies correspond to settings you can make using the Applications preference in the Workgroup Manager.

Permit/prohibit access to application list: AppleScript

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Application Access Settings > Permit/prohibit access to application list: AppleScript

Description

Select the specific applications in the Finder's Applications/AppleScript folder that users are permitted to use if you selected **Users can only open these applications**, or not allowed to use if you selected **Users can open all applications except these**.

• • • • •

This policy is only effective if the **Permit/prohibit access to applications** group policy is enabled. If the **Permit/prohibit access to applications** group policy is not configured or disabled, this group policy is ignored.

Once enabled, this group policy takes effect dynamically at the next group policy refresh interval.

Permit/prohibit access to application list: Applications

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Application Access Settings > Permit/prohibit access to application list: Applications

Description

Select the specific applications in the Finder's Applications folder that users are permitted to use if you selected **Users can only open these applications**, or not allowed to use if you selected **Users can open all applications except these**.

This policy is only effective if the **Permit/prohibit access to applications** group policy is enabled. If the **Permit/prohibit access to applications** group policy is not configured or disabled, this group policy is ignored.

Once enabled, this group policy takes effect dynamically at the next group policy refresh interval.

Permit/prohibit access to application list: Server

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Application Access Settings > Permit/prohibit access to application list: Server

Description

Select the specific applications in the Finder's Applications/Server folder that users are permitted to use if you selected **Users can only open these applications**, or not allowed to use if you selected **Users can open all applications except these**.

This policy is only effective if the **Permit/prohibit access to applications** group policy is enabled. If the **Permit/prohibit access to applications** group policy is not configured or disabled, this group policy is ignored. In addition, this policy is only applicable for Mac OS X Server computers.

Once enabled, this group policy takes effect dynamically at the next group policy refresh interval.

Permit/prohibit access to application list: Utilities

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Application Access Settings > Permit/prohibit access to application list: Utilities

Description

Select the specific applications in the Finder's Applications/Utilities folder that users are permitted to use if you selected **Users can only open these applications**, or not allowed to use if you selected **Users can open all applications except these**.

This policy is only effective if the **Permit/prohibit access to applications** group policy is enabled. If the **Permit/prohibit access to applications** group policy is not configured or disabled, this group policy is ignored.

Once enabled, this group policy takes effect dynamically at the next group policy refresh interval.

Permit/Prohibit access to applications

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Application Access Settings > Permit/prohibit access to applications

Description

Allow other policies to specify the applications that users are permitted to access or prohibited from accessing. You must enable this policy for any other application access group policies to take effect. Once enabled, only the applications explicitly specified in Application List policies are permitted or prohibited.

If you enable this policy, in **Access mode**, select one of the following:

- **Users can only open these applications** to grant access only to the applications you select with the other application access policies.
Note If you select the option: "User can also open all applications on local volumes" users can access any local applications. Restrictions only apply to applications on CDs, DVDs, or external disks.
- **Users can open all applications except these** to prevent access only to the applications you select with the other application access policies.

You can also set the following options in this group policy:

- Select **User can also open all applications on local volumes** to allow access to applications on a computer's local hard drive.
If selected, users can access any local applications in addition to the applications explicitly approved using the other application access policies. If you uncheck this option, users can only access applications on CDs, DVDs, or external disks that have been explicitly approved.
- Select **Allow approved applications to launch non-approved applications** to allow approved applications to open applications that aren't explicitly approved.

For example, if users click a link in an email message, this option allows the email application to open a browser to display the Web page even if the browser is not listed as an approved application. To prevent approved applications from opening applications that aren't explicitly approved, uncheck this option.

- Select **Allow UNIX tools to run** to allow applications or the operating system to run tools, such as the QuickTime Image Converter, without explicitly listing them as approved applications.

These tools usually operate in the background, but can be run from the command line. If you want to prevent access to these tools, do not check this option.

Once enabled, this group policy takes effect dynamically at the next group policy refresh interval.

Permit/prohibit access to the user-specific applications

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Application Access Settings > Permit/prohibit access to the user-specific applications

Description

Define a list of additional applications that users are permitted to run if you selected **Users can only open these applications**, or not allowed to use if you selected **Users can open all applications except these**. If enabled, you must specify the `CFBundleIdentifier` to identify the application; for example, for the Firefox browser, the `CFBundleIdentifier` is: `org.mozilla.firefox`. To find the `CFBundleIdentifier` complete the following steps:

1. In the Finder, locate the application to control.
2. Control-click or right-click the application, then select **Show Package Contents**.

• • • • •

3. If necessary, expand the `Contents` folder, then open `info.plist` with a text editor.
4. Find the string: `<key>CFBundleIdentifier</key>`.

On the next line is the application's `CFBundleIdentifier`; for example:

```
<string>org.mozilla.firefox</string>
```

5. Use `org.mozilla.firefox` to identify the Firefox browser.

To add an application to the list, select **Enabled**, then click **Add** and enter the `CFBundleIdentifier` and click **OK**.

You may also control access to system preference panes by using the `CFBundleIdentifier`. You can find the `CFBundleIdentifier` for system preference panes in `/System/Library/PreferencePanels`. You can specify any application object that has a `CFBundleIdentifier` in its `info.plist` file.

Note Some applications may not have a `CFBundleIdentifier` (when you right-click the application name, there is no **Show Package Contents** menu item). In this case, you cannot add the application to the list of permitted or prohibited applications.

This policy is only effective if the **Permit/prohibit access to applications** group policy is enabled. If the **Permit/prohibit access to applications** group policy is not configured or disabled, this group policy is ignored.

Once enabled, this group policy takes effect when users log out and log back in.

Automount Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Automount Settings

Description

Use the Automount Settings to automatically mount network shares and the user's Windows home directory when a user logs in.

Automount network shares

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Automount Settings > Automount network shares

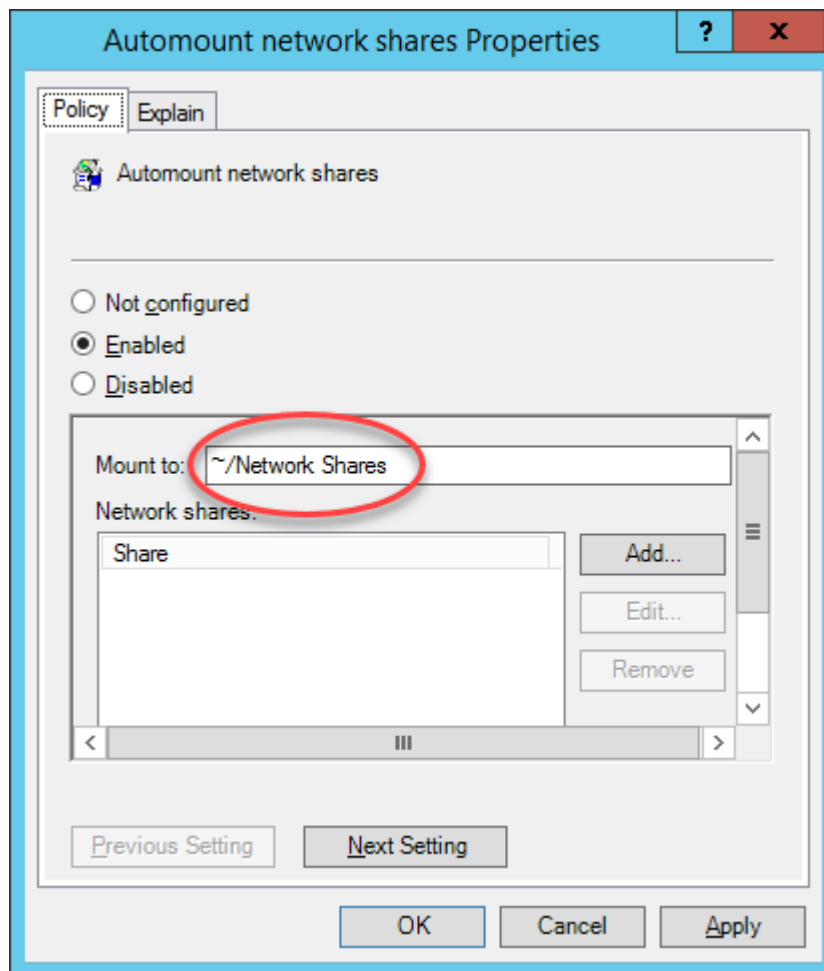

Description

Specify the network shares to automatically mount when a user logs in. The default network share mount location is *User_Home/Network Share*.

This policy supports SMB, AFP, and NFS shares.

To add a share

1. Enter a path to mount the share in the **Mount to:** field.
The path should start with / or ~. The default value is ~/Network Shares. In this case, network share folders would be mounted under the directory Network Shares of user's home directory.

2. Click **Enabled**, then click **Add** and enter the share in one of the following formats:

keyword://server/share

where:

- keyword is one of smb, nfs, afp
- server is the name or IP address of the server and can include a user or user and password in the form: user:@server or user:password@server.
- share can include spaces and be followed by a subdirectory.

For example, the following are all valid share specifications:

smb://acme.com/MacUsers

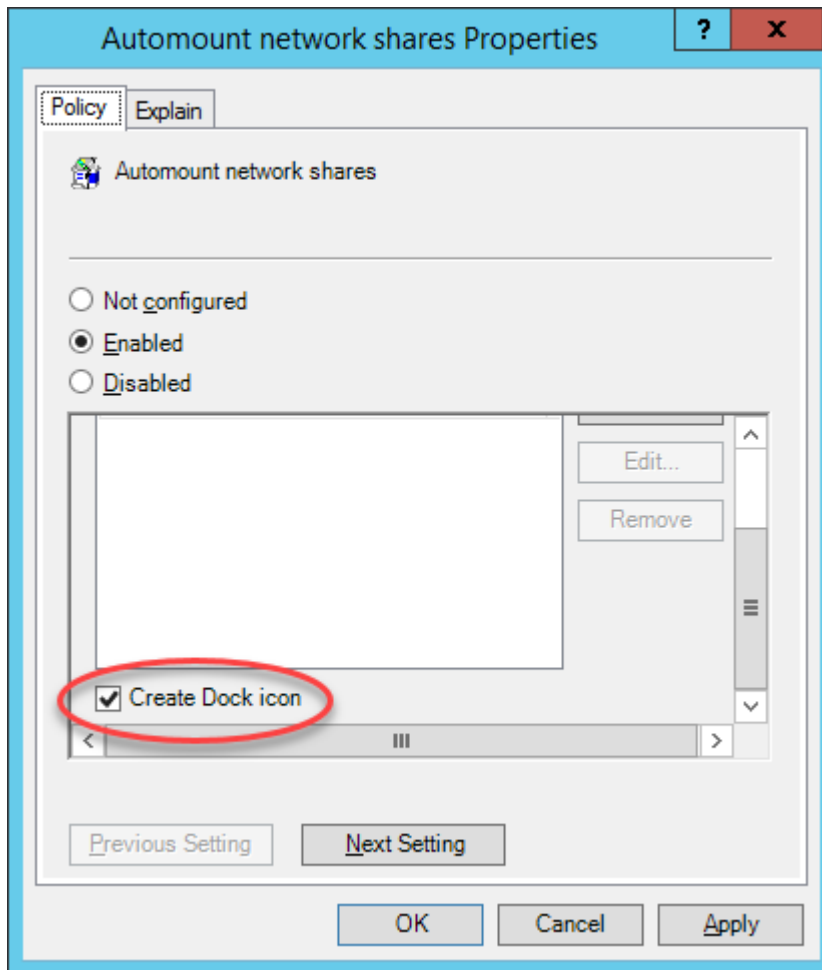

smb://acme.com/Mac Users

smb://acme.com/MacUsers/Shared_resources

.....

```
smb://jsmith:pass1234@acme.com/MacUsers  
afp://acme.com/Users_server  
nfs://acme.com/MacUsers  
nfs://192.168.0.1/MacUsers
```

3. (Optional) Select **Create Dock icon** to create a link to the network share in the user's Dock.

Once enabled, this policy takes effect when a user logs out and back in to a computer.

Automount user's Windows home

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Automount Settings > Automount user's Windows home

Description

Automatically mount the user's Windows home directory when the user logs in.

Specify the Windows home directory by using the Profile tab for a user in Active Directory Users and Computers (ADUC).

Once enabled, this policy takes effect when a user logs out and back in to a computer.

Create alias instead of symbolic link

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Automount Settings > Create alias instead of symbolic link

Description

This group policy is provided for compatibility with Centrify releases earlier than 2015. If you are using release 2015 or later, do not use this group policy.

In releases prior to 2015, the default mount point for network shares was `/var/centrify/mnt/user`. Starting with release 2015, the default mount point for network shares is `User_Home/Network Share`.

In Centrify releases prior to 2015, the "Automount network shares" group policy creates symbolic links to the specified shared network directories.

However, certain versions of Microsoft Office are unable to save files to a shared folder by using the symbolic link (the link is greyed-out). The “Create alias instead of symbolic link” group policy corrects the problem by creating an alias instead of a symbolic link. In release 2015 or later, because of the new mount location, symbolic links are not required, and this group policy has no effect.

If you enable this group policy, the alias points to network shares that are automatically mounted when a user logs in.

Note The operating system treats an alias as a file, which means that you cannot use the Terminal program to access files or folders that are pointed to by the alias.

Once enabled, this policy takes effect when a user logs out and back in to a computer.

Custom Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Custom Settings

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Custom Settings > Install MobileConfig Profiles** group policy to install mobile configuration profiles. This policy installs a user profile. To install a device profile, use the same policy in **Computer Configuration > Centrify Settings > Mac OS X Settings > Custom Settings**.

Install MobileConfig profiles

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Custom Settings > Install MobileConfig profiles

Description

Enable this group policy to install mobile configuration profiles on managed Mac computers.

Note There is a Computer Configuration version of this policy (which installs device profiles) and a User Configuration version (which installs user profiles).

Before enabling this policy, you must create a directory and copy mobile configuration files to SYSVOL on the domain controller. SYSVOL is a well-known shared directory on the domain computer that stores server copies of public files that must be shared throughout the domain.

Specifically, create the following directory on the domain controller:

`\\domainName\SYSVOL\domainName\mobileconfig`

and copy one or more mobile configuration profile files to this directory. See [Deploy configuration profiles to multiple computers](#) for details on how to do this.

To specify mobile configuration files to install, enable the policy, then click **Add**. Enter the name of a mobile configuration file that you placed in SYSVOL on the domain controller. Include the `.mobileconfig` suffix with the name.

If you specify a file that is not in the SYSVOL mobileconfig directory, the profile will not be installed.

If you add new files to the existing list in the group policy, those profiles will be installed — existing profiles will not be touched. If you remove previously specified files, the profiles defined by these files will be uninstalled.

If you add two or more profile files that have the same `payloadIdentifier`, only one of them will be installed.

• • • • •

If you change the group policy to “Disabled” or “Not Configured”, all existing profiles that were installed previously by the group policy will now be uninstalled from the managed Mac computers.

Desktop Settings

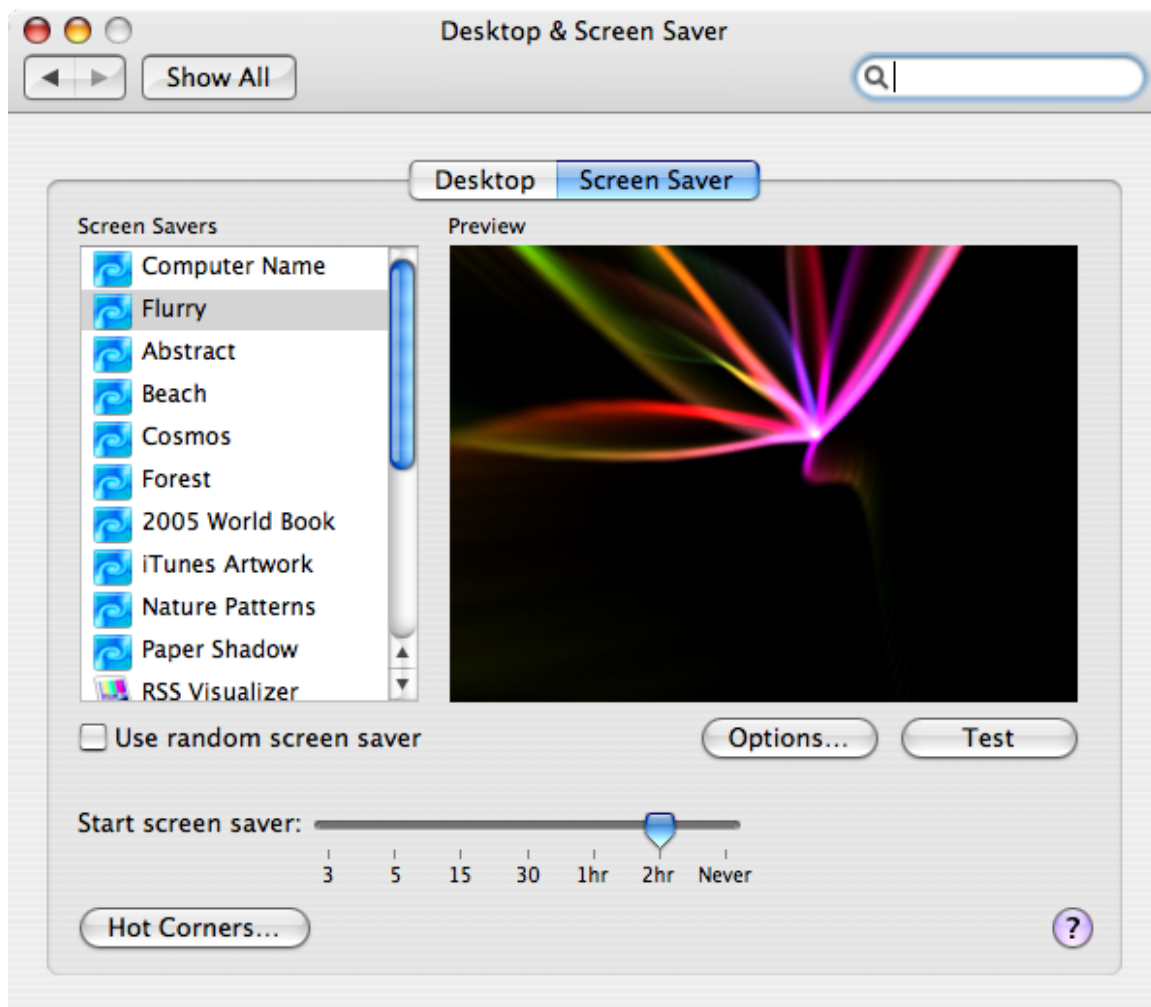

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Desktop Settings

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Desktop Settings** group policy to manage the start time for the

screen saver from the Desktop & Screen Saver () system preference on Mac computers. This group policy corresponds to the **Start screen saver** option displayed on the Screen Saver pane. For example:

Set computer idle time for starting screen saver

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Desktop Settings > Set computer idle time for starting screen saver

Description

Select the length of time to wait before starting the screen saver. If you enable this group policy, you can specify the number of minutes to wait while a computer is not in use before starting the screen saver. For example, if you

want the screen saver to start after a computer has been idle for 10 minutes, you can set Start screen saver to 10 minutes.

Disabling this policy does *not* disable the screen saver. To disable the screen saver, enable this policy and set the value to 0.

Although you may specify values greater than 60 minutes, and the screen saver works appropriately, the Macintosh Screen Saver dialog box shows values that are greater than 60 as **Never**.

Enabling this group policy is the same as selecting when to start the screen saver using the **Start screen saver** slider in the Desktop & Screen Saver system preference.

Once enabled, this group policy takes effect when users log out and log back in.

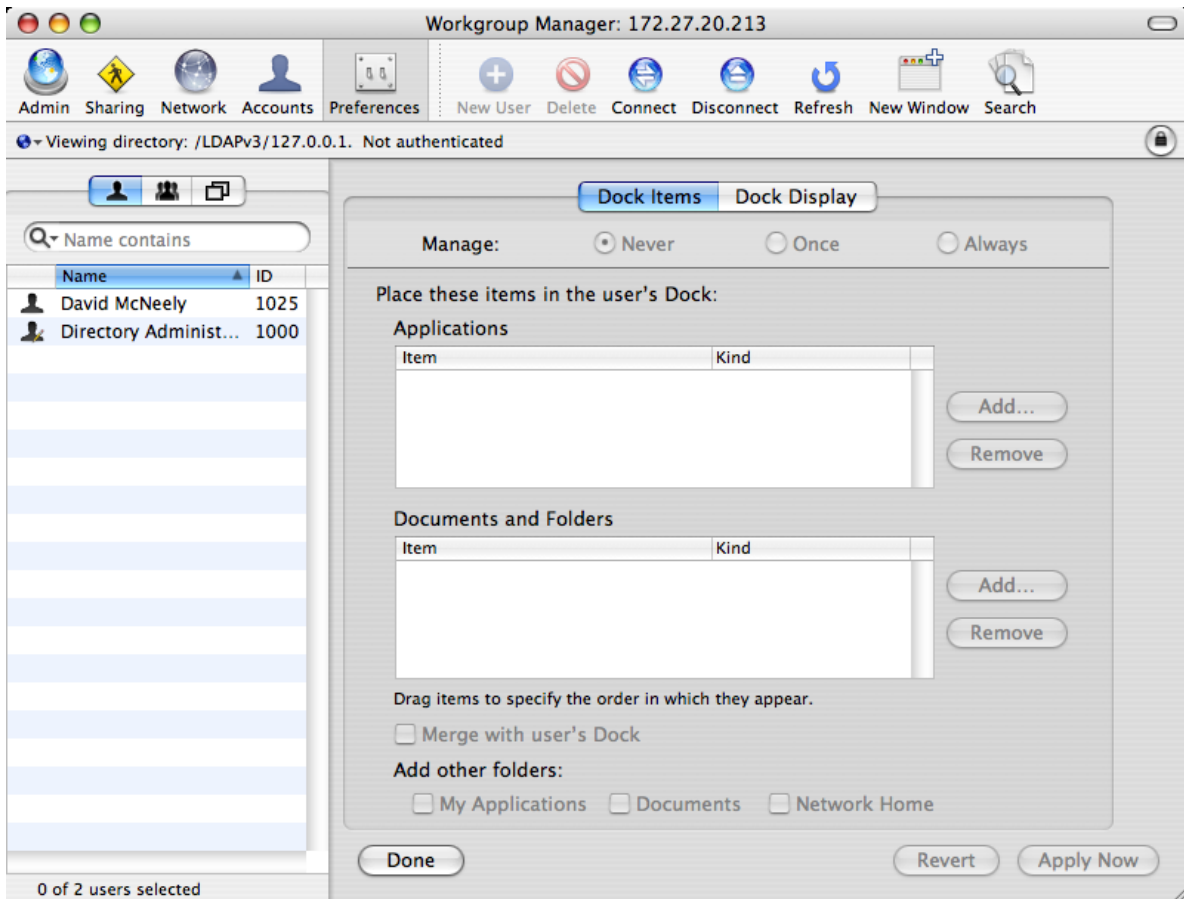

Dock Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings** group policies to manage the characteristics of the Dock for Mac users. These settings correspond to the Dock preferences you can manage using the Workgroup Manager. In the Workgroup Manager, the Dock Items pane controls the items placed in the Dock and whether the workgroup Dock is merged with the user's Dock, and the Dock Display pane controls attributes such as the Dock size, magnification, position, and animation. For example:

Add other folders to the Dock

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings > Add other folders to the Dock

Description

Add icons for the other commonly-used folders to the Dock. You can choose to add the following folder icons to the Dock:

- My Applications
- Documents

• • • • •

The **My Applications** folder contains aliases to all approved applications you have defined in the Application list. If you do not manage access to applications, all available applications are included in the My Applications folder. If you enable Simple Finder, you should display the My Applications folder.

The **Documents** folder is the Documents folder found in the user's home folder. For example, the `/Users/username/Documents` folder for local user accounts.

Once enabled, this group policy takes effect when users log out and log back in.

Adjust the Dock's icon size

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings > Adjust the Dock's icon size

Description

Set the approximate size of Dock icons in pixels. The valid settings for the Dock size range from 16 pixels (small) to 128 pixels (large). The default size is 80 pixels.

Note This setting is approximate because the actual size of Dock icons depends on screen resolution and the number of icons in the Dock.

Once enabled, this group policy takes effect when users log out and log back in.

Adjust the Dock's magnified icon size

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings > Adjust the Dock's magnified icon size

Description

Set the level of magnification to use for items in the Dock. If you enable this group policy, icons in the Dock are magnified to display in a larger size as the pointer moves over them. The valid settings for Dock magnification range from 16 pixels for minimum magnification to 128 pixels for maximum magnification. The default size is 80 pixels.

If you do not configure or disable this group policy, icons in the Dock are not magnified when the pointer moves over them.

Once enabled, this group policy takes effect when users log out and log back in.

Adjust the Dock's position on screen

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings > Adjust the Dock's position on screen

Description

Specify the location for displaying the Dock on the screen. If you enable this group policy, you can position the Dock on the left, bottom, or right of the screen. The default location for displaying the Dock is at the bottom of the screen.

• • • • •

Once enabled, this group policy takes effect when users log out and log back in.

Adjust the effect shown when minimizing the Dock

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings > Adjust the effect shown when minimizing the Dock

Description

Specify the effect to use when a window or application is minimized and placed in the Dock. The valid effects are:

- Genie
- Scale
- Suck

Once enabled, this group policy takes effect when users log out and log back in.

Animate opening applications

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings > Animate opening applications

Description

Animate application icons so that the icon displayed in the Dock bounces when the user opens the application.

• • • • •

Once enabled, this group policy takes effect when users log out and log back in.

Automatically hide and show the Dock

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings > Automatically hide and show the Dock

Description

Hide the Dock from view automatically. If you enable this policy, the Dock is hidden during normal operation. The Dock is then automatically displayed again if the pointer moves over the position on the screen where the Dock is located.

Once enabled, this group policy takes effect when users log out and log back in.

Lock the Dock

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings > Lock the Dock

Description

Lock the applications displayed in the Dock. If you enable this policy, icons cannot be moved into or out of the Dock.

Once enabled, this group policy takes effect when users log out and log back in.

Place applications in Dock

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings > Place applications in Dock

Description

List the applications to include in the Dock. After you enable this policy, click **Add** to enter the path to the application you want included in the Dock. Then click **OK**. You can click **Add** again to add additional applications. For example, to add Firefox and Chess icons to the Dock, type the application paths:

```
/Applications/Firefox.app
```

Click **OK**. Then click **Add** and enter:

```
/Applications/Chess.app
```

The icons for the applications you specify are placed to the left or above the separator line in the Dock in the order you enter them, up to 10 items. If you add more than 10 the order may be random. If the path to an application is incorrect, a question mark (?) is displayed in the Dock in place of the application's icon.

This group policy does not sort icons from the initial system list. To sort these items, such as the Mail application icon, you can add the item to the list.

Once enabled, this group policy takes effect when users log out and log back in.

Place documents and folders in Dock

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings > Place documents and folders in Dock

Description

List the documents or folders to include in the Dock. After you enable this policy, click **Add** to enter the path to the folder or document you want to include in the Dock. Then click **OK**. You can specify additional folders or documents by clicking **Add** again. For example, to add the users folder and the `copyright.txt` document to the Dock, type the paths to each:

```
/Users
```

Click **OK**, then click Add and type:

```
/Documents/Copyright.txt
```

The icons for the items you specify are placed to the left or above the separator line in the Dock. Items are sorted in the order you enter them up to 10 items. If you specify more than 10 items the order may be random. If the path to an item is incorrect, a question mark (?) is displayed in the Dock.

Note You may not specify the path to a network share; for example, `smb://serverName`. Network share paths are implemented as aliases, which work differently than folder and document paths. If you specify a network share, a question mark (?) is displayed in the Dock.

Once enabled, this group policy takes effect when users log out and log back in.

Merge with user's Dock

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Dock Settings > Merge with user's Dock

Description

Merge the Workgroup Dock settings with the user's Dock.

Once enabled, this group policy takes effect when users log out and log back in.

Finder Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Finder Settings

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Finder Settings** group policies to configure Finder commands, preferences and views.

The [Configure Finder commands \(Deprecated\)](#) policy allows you to control which commands are available in the Apple menu and Finder menus for users.

The [Configure Finder preferences \(Deprecated\)](#) policy enables you to specify the type of Finder for the user environment. After enabling the policy, you can choose one of two types from the drop-down list:

- **Normal Finder** applies the standard Mac desktop. This is the default value, and is the environment that all users will have if the policy is not enabled.
- **Simple Finder** restricts users to applications that are in the Dock.

When Simple Finder is enabled, users cannot open applications, open, modify, or delete documents, or create folders in the Finder. They also cannot mount network drives. They can only use items that are in the Dock. Use the [Dock Settings](#) policies to configure the Dock; for example, enable [Place applications in Dock](#) and [Place documents and folders in Dock](#) to control the applications and folders that users can access.

The [Configure Finder preferences \(Deprecated\)](#) policy enables you to control the arrangement and appearance of items on the user's desktop, in Finder windows, and in the top-level folder of the computer.

The Finder Settings policies are as follows:

- [Configure Finder commands \(Deprecated\)](#)
- [Configure Finder preferences \(Deprecated\)](#)

Configure Finder commands (Deprecated)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Finder Settings > Configure Finder commands (Deprecated)

Description

Specify the commands in Finder menus and the Apple menu that are available to users. Select commands from the following list:

- **Connect to Server**

Select to allow users to connect to a remote server by choosing 'Connect to Server' in the Finder Go menu. Deselect to prevent users from accessing this command.

- **Go to iDisk**

Select to allow users to connect to an iDisk by choosing 'Go to iDisk' in the Finder Go menu. Deselect to prevent users from accessing this command.

- **Eject**

Select to allow users to eject discs (for example, CDs, DVDs, floppy disks, or FireWire drives). Deselect to prevent users from ejecting disks.

- **Burn Disc**

Select to allow user on computers with relevant hardware to burn discs. Deselect to prevent users from burning disks.

- **Go to Folder**

Select to allow users to open a specific folder by choosing the 'Go to Folder' command in the Finder Go menu. Deselect to prevent users from using the 'Go to Folder' command.

- **Restart**

Select to allow users to restart the computer they're using, or deselect to prevent them from restarting the computer.

- **Shut Down**

Select to allow users to shut down the computer they're using, or deselect to prevent them from shutting down the computer.

Once enabled, this group policy takes effect when users log out and back in.

Configure Finder preferences (Deprecated)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Finder Settings > Configure Finder preferences (Deprecated)

Description

Configure Finder preferences, including whether to use normal or Simple Finder, which items to show on the desktop, how a new window behaves, and whether to show filename extensions and the Empty Trash warning.

Select from the following options:

- **Finder type**

Select the normal Finder or Simple Finder as the user environment. The normal Finder looks and acts like the standard Mac desktop. Simple Finder removes the ability to use a Finder window to access applications or modify files, limiting users' access to only what is in the Dock. In addition, users can't mount network volumes, create folders, or delete files.

- **Show these items on the Desktop**

Choose whether users see icons for local hard disks, external disks, CDs (DVDs and iPods), and connected servers on the desktop.

If you hide them, icons for disks and servers still appear in the top-level folder when a user clicks the Computer icon in a Finder window's toolbar.

- **New Finder window shows**

Select **Home** to show items in the user's home folder, or select **Computer** to show the top-level folder, which includes local disks and mounted volumes.

- **Always open folders in a new window**

Select this option to display folder contents in a separate window when a user opens a folder.

- **Always open windows in column view**

Select this option to display folders in column view, which maintains a consistent view across windows.

- **Show warning before emptying the Trash**

Select this option to display the normal warning when a user empties the Trash, or deselect it if you don't want users to see this message.

- **Always show file extensions**

Select this option to show filename extensions (such as `.txt` or `.jpg`) that identify the file type; or deselect it to hide filename extensions.

Once enabled, this group policy takes effect when users log out and back in.

- **Configure Finder views**

Enable this group policy to control Finder views, for example the arrangement and appearance of items on a user's desktop, in Finder windows, and in the top-level folder of the computer.

The options in **Desktop View** allow you to adjust the size and arrangement of icons on the desktop.

Use **Icon Size** to adjust the icon size.

Use **Icon Arrangement** to specify how to arrange icons:

- To keep items aligned in rows and columns, select **Snap to grid**.
- To arrange items by criteria such as name or type (for example, all folders grouped together), select **Keep arranged by**.

Items in Finder windows are viewed in a list or as icons and you can control aspects of how these items look.

Default View settings control the overall appearance of all Finder windows. **Computer View** settings control the view for the top-level computer folder, showing hard disks and disk partitions, external hard drives, mounted volumes, and removable media (such as CDs or DVDs).

In **Icon View**, use **Icon Size** to adjust the size of icons.

Use **Icon Arrangement** to specify how to arrange icons:

- To keep items aligned in rows and columns, select **Snap to grid**.
- To arrange items by criteria such as name or type (for example, all folders grouped together), select **Keep arranged by**.

In **List View**, set the following:

- Select **relative dates** to show an item's creation or modification date relative to today, rather than as a fixed date; for example, Today, or yesterday, instead of 3/24/10.
- Select **Calculate folder sizes** to calculate the total size of each folder shown in a Finder window, which can take a lot of time depending on the size of the folder.

In **Icon Size**, select **small** or **big** for the size of icons in list view.

Once enabled, this group policy takes effect when users log out and back in.

Folder Redirection

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Folder Redirection

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Folder Redirection** group policies to redirect specified folders from a network home directory to the local computer.

When you set up a network home directory, all home directory files are written to the network share. Some folders, such as `/Library/Caches`, get heavy I/O from Apple and third-party applications, which may cause performance issues. The folder redirection policies enable you to redirect specific folders, such as `/Library/Caches`, to the local computers, which can result in dramatic performance improvements.

Folder Redirection contains two folders with identical sets of four policies:

- **Folder redirection actions at login time** applies the specified policy when the user logs in. For example, at login delete a folder in the network home directory and create a symbolic link to it on the local computer.
- **Folder redirection actions at logout time** applies the specified policy when the user logs out. For example, at logout, delete the symbolic link on the local computer (created at login) and restore the original folder to the network home directory.

After enabling the policy, click **Add**, then enter the following:

- **Path** The path to the folder on the network share. You do not need to specify the actual network share location — you can simply use the tilde (`~`) for the user's home directory; for example, `~/Library/Caches` specifies the `/Library/Caches` directory in the user's network home directory.
- **Link** The location to create or delete on the local computer. For example:

```
/tmp/Library/Caches
```

- If you wish, you can use the syntax `%@` to specify the logged in user's name. For example:

```
/tmp/%@/Library/Caches
```

If `cain` is the logged in user, the folder that is created is:

```
/tmp/cain/Library/Caches
```

The Folder Redirection policies are as follows:

- [Delete path](#)
- [Delete symbolic link and restore](#)

• • • • •

- Delete and create symbolic link
- Rename and create symbolic link

Delete path

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Folder Redirection > Folder Redirect Actions at Login/Logout Time > Delete path

Description

Deletes the specified directory from the network home directory. For example, to delete the `/Library/Caches` file from each user's home directory, enter the following in the **Path** box:

```
~/Library/Caches
```

Typically, you enable this policy for the **login time** folder.

Note You are not required to enter anything in the **Link** box for this group policy, and in fact, anything you enter in this box will be ignored. All the policies in this folder are implemented with the same UI and the other policies require the Link box so it appears for this policy as well.

Once this group policy is enabled, it takes effect when users log in (enabled for **login time** folder) or log out (enabled for **logout time** folder).

Delete symbolic link and restore

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Folder Redirection > Folder Redirect Actions at Login/Logout Time > Delete symbolic link and restore

Description

Deletes a previously defined symbolic link on the local computer and restores the specified directory to the network home directory. Typically, you use this policy with the Rename and create symbolic link policy. For example:

At login (using Rename and create symbolic link) you save ~/Library/Caches in the network home directory to a temporary folder and redirect it to a folder on the local computer, for example /tmp/user/Library/Caches. At logout, you can enable Delete symbolic link and restore to delete the symbolic link and restore the folder on the network home directory, by specifying the following:

- **Path:** ~/Library/Caches
- **Link:** /tmp/%@/Library/Caches

where: %@ specifies the logged in user's name on the local computer.

Once this group policy is enabled, it takes effect when users log in (enabled for **login time** folder) or log out (enabled for **logout time** folder).

Delete and create symbolic link

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Folder Redirection > Folder Redirect Actions at Login/Logout Time > Delete and create symbolic link

Description

Deletes the specified directory from the network home directory and creates a symbolic link to it on the local computer.

For example, to delete the user's /Library/caches policy from the network home directory and create a link to it on the local computer, specify the following after enabling the policy:

• • • • •

- **Path:** ~/Library/Caches
- **Link:** /tmp/%@/Library/Caches

where %@ specifies the logged in user's name on the local computer. For example, if cain is the logged in user, the cache files are written to:

```
/tmp/cain/Library/Caches
```

Once this group policy is enabled, it takes effect when users log in (enabled for **login time** folder) or log out (enabled for **logout time** folder).

Rename and create symbolic link

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Folder Redirection > Folder Redirect Actions at Login/Logout Time > Rename and create symbolic link

Description

Renames the specified directory in the network home directory to a temporary folder and creates a symbolic link to it on the local computer.

For example, to rename the user's /Library/Caches policy on the network home directory and create a link to it on the local computer, specify the following after enabling the policy for the **login time** folder:

- **Path:** ~/Library/Caches
- **Link:** /tmp/%@/Library/Caches

where %@ specifies the logged in user's name on the local computer. For example, if cain is the logged in user, the cache files are written to:

```
/tmp/cain/Library/Caches
```

To restore the original /Library/Caches directory, use the Delete symbolic link and restore policy (enabled for the **logout time** folder).

Once this group policy is enabled, it takes effect when users log in (enabled for **login time** folder) or log out (enabled for **logout time** folder).

Import Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Import Settings

Description

Mac OS X uses plist files to store application and other preferences. Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Import Settings** group policies to import plist files to customize your preferences:

- **Import plist files.** This group policy allows you to import preferences from another computer to computers in your Centrify-managed domain. To do so you:
 - Copy the plist files you want to use to the system volume on the domain controller.
 - Use the Import plist files group policy to import the plist files to computers in the domain.

This group policy automatically processes plist files to extract MCX settings when the files are imported.

- **Import MCX setting plist files.** This group policy is similar to the **Import plist file** group policy, except that it does not process any data from the inputted plist files. This group policy copies the exact content (that is, the “raw” content) from the plist file and imports it to the Active Directory user record.

When you import the plist files, Centrify copies them to the appropriate directories on the local computers to implement the preferences that they control.

• • • • •

You can gather and copy plist files from multiple computers and paste them to the sysvol directory on the domain controller, but a more structured approach is to set up a preferences ‘template’ computer, that is, a computer that is set up with your desired preferences. Then you can copy the appropriate plist files to sysvol on the domain controller. Finally, you can use either of the group policies described here to import the plist files to Centrify-managed computers in the domain.

Mac OS X stores plist files in the /Library/Preferences directory and in the /Users/*userName*/Library/Preferences directory.

The following section shows specifics of using these group policies.

Import plist files

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Import Settings > Import plist files

Description

Specify the names of plist files to import from the system volume (SYSVOL) — similar to importing plist files in Mac Workgroup Manager. By default, the system volume folder is at: `\\domain\SYSVOL\domain\plist`.

Before enabling this policy, you should copy all the plist files to import to the system volume (sysvol) on the domain controller.

To add a file, select **Enabled**, click **Add**, then type a filename.

The path you type in **plist file** is relative to `\\domain\SYSVOL\domain\plist`. For example, if the domain name is `ajax.org` and you enter a plist file named `com.apple.MCX.plist`, the file that gets imported is:

```
\\ajax.org\sysvol\ajax.org  
\com.apple.MCX.plist
```

You can specify additional relative directories in the path, if needed.

.....

Once this group policy is enabled, it takes effect when users log out and log back in.

Import MCX setting plist files

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Import Settings > Import MCX setting plist files

Description

Enable this group policy to import raw MCX settings plist files from SYSVOL. By default the folder is \\<domain>\SYSVOL\<domain>\mcxplist, similar to importing plist files in Mac Workgroup Manager.

The plist file path that you specify is relative to this path:

```
\\<domain>\SYSVOL\<domain>\mcxplist
```

For example, if you specify this path:

```
com.apple.MCX.plist
```

the following plist file is imported:

```
\\<domain>\SYSVOL\<domain>\mcxplist\com.apple.MCX.plist
```

This group policy is similar to "Import plist files". However, instead of extracting MCX settings from the plist file like "Import plist files" does, this policy imports the entire plist file without processing it.

An example plist file format is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple//DTD PLIST 1.0//EN"
"http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
    <key>mcx_application_data</key>
```

.....

```
<dict>
  <key>TARGET</key>
  <dict>
    <key>Forced</key>
    <array>
      <dict>
        Settings
      </dict>
    </array>
  </dict>
</dict>
</dict>
</plist>
```

In this example, TARGET is the targeted MCX settings (such as com.apple.dock or com.apple.finder)

The recommended way to obtain the plist file with the correct format is by using the dscl command, and reading the MCX settings attribute of the user object that has the same MCX settings configured. Then copy the exact MCX settings and paste them into a plist file.

For example:

```
dscl /CentrifyDC read /Users/XXXX MCXSettings
```

where XXXX is an Active Directory user with the desired MCX settings.

Login Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Login Settings

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Login Settings** group policy to specify frequently used items, such as applications, folders, or server connections to automatically open when a user logs in.

After enabling this policy, you can do the following:

- Use the **Add** button to specify the path to applications to open.
- In the **Network Home** area, use the **Add** button to specify URLs for servers to connect to; use the check box to specify whether to automatically connect the logged in user to the specified servers.
- Use the other check boxes to control whether users have the ability to add or remove login items.

The following table shows specifics of using this group policy.

Note Only the **Login items** area is visible when you first open the properties page for the group policy. Use the scroll bar to see the **Network share** area and other items that you can configure with this policy.

Enable login items

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Login Settings > Enable login items

Description

Specify the names of applications, folders, and server locations to open automatically when a user logs in. Select **Enable**, then do any or all of the following:

- **Login items.** To add an application to open automatically, click **Add**, then type the path to the application; for example:

```
/Applications/TextEdit.app
```

To initially hide the application, select **Hide**. The application will open, but its window and menu bar remain hidden until the user activates the application (for example, by clicking the application icon in the doc).

Click **OK** to save the item you entered. You can click **Add** as often as necessary to add multiple applications. You can also select an item in the window and click **Edit** to change it, or **Remove** to delete it.

- **Network share.** To add access to a network share, click **Add**, then type the URL in one of the following formats:

```
smb://server/share
smb://server/hidden$
smb://server/share/subdir
smb://user:password@server/share
smb://user:@server/share
afp://server/share
nfs://server/share
nfs://192.168.0.1/share
```

To automatically connect the user to the share with the user's login name and password, select **Authenticate selected share point with user's login name and password**.

Note If you uncheck this option, the share name must comply with [RFC 1738 - Uniform Resource Locators \(URL\)](#), which specifies that special characters need to be encoded, for example, by using %20 instead of a space.

If the network share can be authenticated using Kerberos, this option can be ignored. If the network share cannot be authenticated using Kerberos, and this option is unchecked, then the user will be prompted for a username and password.

If a username is specified in the URL for the network share, then checking this option will still mount the share as the login user, while deselecting this option will mount the share as the user specified in the URL. For example, if network share is `smb://mount_user:password@server/share`, checking the option will

• • • • •

mount the share as `login_user`, while deselecting the option will mount the share as `mount_user`.

Click **OK** to save the item you entered. You can click **Add** as often as necessary to add multiple shares. You can also select an item in the window and click **Edit** to change it, or **Remove** to delete it.

- Select **User may add and remove additional items** to allow users to add items to the list and remove items from the list.

Deselect this box to prevent users from adding items or removing the items that you have specified. Note that they can remove login items that they specified on their own.

- Select **User may press Shift to keep items from opening** to allow user's to stop items from opening by holding down the Shift key during login until the Finder appears on the desktop.

Deselect this option to prevent users from stopping applications from opening automatically.

Once enabled, this group policy takes effect when users log out and log back in.

Media Access Settings

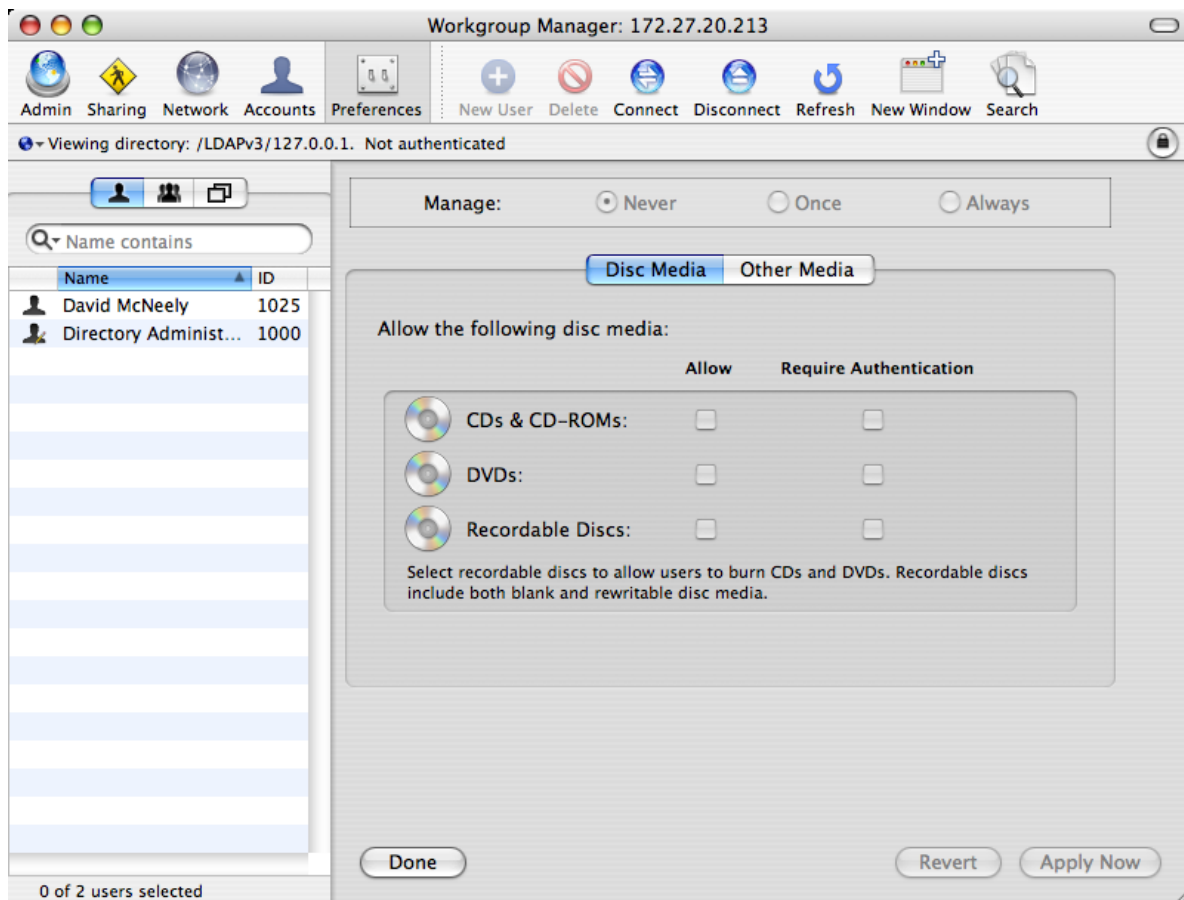

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Media Access Settings

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Media Access Settings** group policies to manage the access to discs and other media for Mac users. These group policies enable you to control access to specific types of media, such as CDs or DVDs, but you cannot restrict access to specific discs or to specific items, such as music or movies, on a disc type users are permitted to access. These settings

correspond to the Media Access preferences you can manage using the Workgroup Manager. For example:

Permit/prohibit access: CDs and CD-ROMs

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Media Access Settings > Permit/prohibit access: CDs and CD-ROMs

Description

Control whether users can access data and applications on CDs and CD-ROMs. The valid options are:

- **allow** to allow access to CDs and CD-ROMs without authentication.
- **allow, require authentication** to require users to provide credentials for authentication before allowing them access to CDs and CD-ROMs.
- **deny** to prevent users from accessing any data or applications on CDs and CD-ROMs.

Once this group policy is enabled, it takes effect when users log out and log back in.

Permit/prohibit access: DVDs

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Media Access Settings > Permit/prohibit access: DVDs

Description

Control whether users can access data and applications on DVDs. The valid options are:

- **allow** to allow access to DVDs without authentication.
- **allow, require authentication** to require users to provide credentials for authentication before allowing them access to DVDs.
- **deny** to prevent users from accessing any data or applications on DVDs.

Once this group policy is enabled, it takes effect when users log out and log back in.

Permit/prohibit access: Recordable Discs

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Media Access Settings > Permit/prohibit access: Recordable Discs

Description

Control whether users can record or access data and applications on recordable discs. The valid options are:

- **allow** to allow access to recordable discs without authentication.
- **allow, require authentication** to require users to provide credentials for authentication before allowing them access to recordable discs.
- **deny** to prevent users from accessing any data or applications on recordable discs.

Allowing users access to recordable discs enables users to burn CDs and DVDs. Recordable discs can be blank or rewritable disc media.

Once this group policy is enabled, it takes effect when users log out and log back in.

Permit/prohibit access: Internal Discs

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Media Access Settings > Permit/prohibit access: Internal Discs

Description

Control whether users can access data and applications on internal discs. The valid options are:

- **allow** to allow read and write access to internal discs without authentication.
- **allow, read-only** to allow read-only access to the media.
- **allow, require authentication** to require users to provide credentials for authentication before allowing them access to the media.
- **allow, require authentication, read-only** to require users to provide credentials for authentication before allowing them access to internal discs, and grant **read-only access to the media** if authentication is successful.
- **deny** to prevent users from accessing any data or applications on internal discs.

Once this group policy is enabled, it takes effect when users log out and log back in.

Permit/prohibit access: External Discs

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Media Access Settings > Permit/prohibit access: External Discs

Description

Control whether users can access data and applications on external discs. External disks include floppy disks, FireWire drives, and all other external storage devices except CDs and DVDs. The valid options are:

- **allow** to allow read and write access to external discs without authentication.
- **allow, read-only to allow read-only access to** external discs.
- **allow, require authentication** to require users to provide credentials for authentication before allowing them access to external discs.

- **allow, require authentication, read-only** to require users to provide credentials for authentication before allowing them access to external discs, and grant **read-only access to the media** if authentication is successful.
- **deny** to prevent users from accessing any data or applications on external discs.

Once this group policy is enabled, it takes effect when users log out and log back in.

Eject all removable media at logout

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Media Access Settings > Eject all removable media at logout

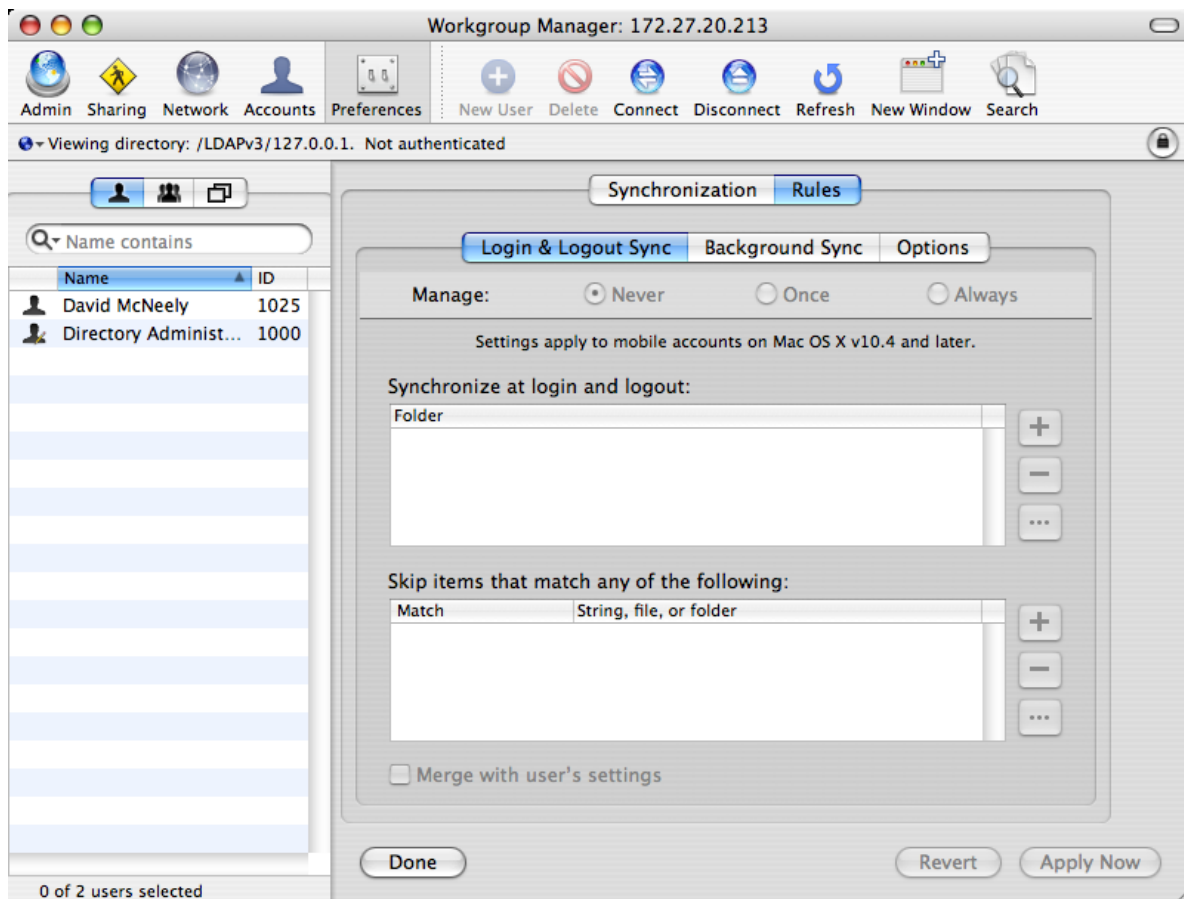

Description

Control whether removable media, such as CDs, DVDs, Zip disks, or FireWire drives, are automatically ejected when users log out. If you enable this group policy, CDs, DVDs, and other disk media are automatically ejected when users log out to ensure removable media is properly disconnected and put away when users end their sessions.

Once this group policy is enabled, it takes effect when users log out and log back in.

Mobility Settings

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings** group policies to manage the synchronization rules for mobile Mac OS X users. These settings correspond to the Mobility preferences you can manage using the Workgroup Manager. The group policy categories correspond to panes in the Workgroup Manager. For example:

The user interface for mobility settings differs significantly between different versions of Mac OS X. Therefore, separate mobility settings group policies are provided for each supported operating system. In addition, to support existing installations that configured group policies by using a previous `centrifdc_mac_settings` template, a set of legacy mobility settings is provided.

The [Use version specific settings](#) group policy determines whether to use legacy settings or platform-specific mobility settings. This group policy is enabled by default. If you do not set it to **Disabled** or **Not configured**, legacy settings are used.

If you enable this group policy, you can then enable platform-specific mobility settings for each platform in your environment; see the following sections for information on each set of policies:

Use version specific settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Use version specific settings

Description

Enable the use of version-specific settings.

If you enable this policy, you can set platform-specific mobility settings for each platform in your environment.

For example, if you have only 10.10 computers, you can enable this policy and then use OS X 10.10 settings. If you have 10.10 and 10.9 computers, enable this policy, and then configure the version-specific policies as appropriate:

- OS X 10.10 Settings
- OS X 10.9 Settings

When a computer joins the domain, Centrify determines the operating system version and applies the appropriate Mobility settings.

If this policy is disabled or not configured, Legacy Settings are used instead of version-specific settings. Likewise, Centrify versions prior to 4.4.2 always use Legacy Settings and ignore this policy setting.

If you configured Mobility Synchronization settings with a version of the product prior to 4.4.2, these settings are saved to Legacy Settings when you upgrade to the current Centrify version. You can keep or edit these settings as you wish.

Note The Legacy Settings may not match exactly the settings for each operating system version; for example, some settings may be missing while others may be redundant for a particular OS version.

When the Direct Manage Access console is running on Windows 2000 SP4 or Windows 2003, some of the mobility synchronization policies cannot be set to disabled, including:

• • • • •

- Skip items
- Sync in the background
- Sync at login and logout

This problem is corrected on Windows 2003 if Service Pack 1 or later is applied to the computer on which the Access Manager console is running.

Mobility Legacy Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings

Description

When you upgrade from a version of Centrify prior to 4.4.2, your Mobility Synchronization settings are saved to Legacy Settings. You can keep or edit the individual legacy mobility group policy settings as you wish.

Note The legacy settings might not match exactly the settings for each operating system version; for example, some settings may be missing while others may be redundant for a particular OS version.

Enable/disable synchronization

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings > Enable/disable synchronization

Description

Create mobile accounts for users automatically and synchronize mobile accounts for offline use. If you enable this policy, a mobile account is created the next time the user logs into the network account.

Check the **Create mobile account even if user does not have a network home directory** option to create mobile accounts automatically for users the next time they log in to the Mac. This applies to all users, including users who do not have a network home directory.

Check the **Require confirmation before creating a mobile account** option if you want the user to be prompted to confirm the creation of the mobile account.

Check **Encrypt contents with FileVault** to encrypt the mobile home directory using the Mac FileVault system.

Note FileVault protection can only be applied when a new mobile user is created at login. FileVault protection cannot encrypt an existing mobile-user home directory.

Select one of the computer master password options. The computer master password is a safety feature that allows you to unlock the FileVault disk image if the Active Directory user forgets their password:

- **Use computer master password, if available** — With this option checked, the mobile account will be created and FileVault protection applied whether or not a computer master password is available.
- **Require computer master password** — With this option checked, the mobile user account will only be created if a master password is available for the computer.

You can create a master password by clicking: **System Preferences > Security > FileVault > Set Master Password**.

This group policy corresponds to settings you make by opening Mobility preferences, then clicking the Synchronization pane in the Workgroup Manager.

Once enabled, this group policy takes effect when users log out and log back in.

Setting synchronization rules for background synchronization

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings > Synchronizaton Rules: Background Sync

Description

Use the group policies in the **Synchronization Rules: Background Sync** category to choose the folders that should be synchronized in the background for users with mobile accounts. You can also use the **Skip these items** group polices to define criteria for folders that should not be synchronized in the background.

Group policies in this category correspond to settings you make by opening Mobility preferences, clicking Rules, then clicking the Background Sync pane in the Workgroup Manager.

Enable/disable background synchronization rules

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings > Enable/disable background synchronization rules

Description

Enable or disable background synchronization for mobile user accounts.

You can set the following options with this policy:

- Check **Merge with user's settings** if you want items selected by the user for background synchronization to be added to the synchronization list.

• • • • •

- Check **Synchronize user's home directory** if you want to synchronize the user's home directory when background synchronization takes place.
- Check **Skip preset items** if you want to automatically skip synchronization for items that usually do not require synchronization. Selecting this option enables the **Skip items whose full path is** policy with a default list of items to skip.

If you select the **Skip preset items** option, the **Skip items whose full path is** policy is configured by default to skip the following items:

`~/Library`

`~/ .Trash`

Once enabled, this group policy takes effect when users log out and log back in.

Adjust items that will be synchronized in the background

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings > Adjust items that will be synchronized in the background

Description

Specify the folders to synchronize in the background for users with mobile accounts.

If you enable this group policy, click **Add** and type a relative path to the files and folders that should be synchronized, then click **OK**. The path should not start with the slash (/) character. If the path you specify does not start with the relative path designation (~), the client adds ~/ to the front of the path. You can specify multiple paths by separating each path with a comma, or by clicking **Add** and typing a path multiple times. For example:

`~/ .bash_profile, ~/Documents/offline`

This policy requires the [Enable/disable background synchronization rules](#) policy to be enabled.

Once this group policy is enabled, it takes effect when users log out and log back in.

Skip these items

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings > Synchronization Rules: Background Sync > Skip these items

Description

Set the criteria to identify folders that should not be synchronized in the background for users with mobile accounts. These group policies allow you to specify a string that identifies files and folders to skip during synchronization:

- Use the **Skip items that start with** policy to skip items that start with the specified string.
The string should not contain the slash (/) character.
- Use the **Skip items that end with** policy to skip items that end with the specified string.
The string should not contain the slash (/) character.
- Use the **Skip items whose name contains** policy to skip items that contain the specified string.
The string should not contain the slash (/) character.
- Use the **Skip items whose name is** policy to skip items that exactly match the specified string.
The string should not contain the slash (/) character.
- Use the **Skip items whose full path is** policy to skip all items the

specified directory.

For example, if you specify ~/Library, no items in ~/Library directory will be synchronized.

- Use the **Skip items whose partial path matches** policy to skip items with a partial path that matches the specified string.

If you enable any of these group policies, click **Show**, then click **Add** and type a string, for example users or /Users,~/Library, then click **OK**.

These policies require the [Enable/disable background synchronization rules](#) policy to be enabled.

Note When the Access Manager console is running on Windows 2000 SP4 or Windows 2003, this policy cannot be set to disabled. This problem is corrected if Service Pack 1 or later is applied to the computer on which the Access Manager console is running.

Once any of these policies are enabled, they take effect when users log out and log back in.

Setting synchronization rules for login and logout

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings > Synchronization Rules: Login & Logout Sync

Description

Use the group policies in the **Synchronization Rules: Login & Logout Sync** category to choose the folders that should be synchronized when users with mobile accounts login and logout. You can also use the **Skip these items** group policies to define criteria for folders that should not be synchronized when mobile users login and logout.

Group policies in this category correspond to settings you make by opening Mobility preferences, clicking Rules, then clicking the Login & Logout Sync pane in the Workgroup Manager.

Enable/disable login & logout synchronization rules

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings > Synchronization Rules: Login & Logout Sync

Description

Enable or disable synchronization at login and logout for mobile user accounts.

You can set the following options with this policy:

- Check **Merge with user's settings** if you want items selected by the user for synchronization at login and logout to be added to the synchronization list.

You should uncheck this option if you want to prevent users from adding items to the synchronization list in their local system preferences that override items you do not want to be synchronized.

- Check **Skip preset items** if you want to automatically skip synchronization for items that usually do not require synchronization.

Selecting this option enables the **Skip items that start with** and **Skip items whose full path is** policies with a default list of items to skip.

If you select the **Skip preset items** option, the **Skip items whose full path is** policy is configured by default to skip the following items:

`~/Library/Application Support/SyncServices`

`~/Library/Caches`

`~/Library/Logs`

`~/Library/Preferences/ByHost`

`~/Library/Printers`

`~/Library/Safari/Icons`

`~/Library/Preferences/com.apple.dock.plist`

`~/Library/Preferences/com.apple.iChatAgent.plist`

• • • • •

```
~/Library/Preferences/com.apple.sidebarlists.plist
```

```
~/Library/Preferences/com.apple.systemuiserver.plist
```

```
~/Library/Preferences/loginwindow.plist
```

If you select the **Skip preset items** option, the **Skip items that start with** policy is configured by default to skip items that start with:

IMAP-

Mac-

Once enabled, this group policy takes effect when users log out and log back in.

Adjust items that will be synchronized at login and logout

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings > Synchronization Rules: Login & Logout Sync > Adjust items that will be synchronized at login and logout

Description

Specify the folders to synchronize when mobile users log in and log out.

If you enable this group policy, click **Show**, then click **Add** and type a relative path to the files and folders that should be synchronized at login and logout, then click **OK**. The path should not start with the slash (/) character. If the path you specify does not start with the relative path designation (~), the client adds ~/ to the front of the path. You can specify multiple paths by separating each path with a comma. For example:

```
~/ .bash_profile, ~/Documents/offline
```

This policy requires the [Enable/disable login & logout synchronization rules](#) policy to be enabled.

Once this group policy is enabled, it takes effect when users log out and log back in.

Skip these items

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings > Synchronization Rules: Login & Logout Sync > Skip these items

Description

Set the criteria to identify folders that should not be synchronized when mobile users log in and log out. These group policies allow you to specify a string that identifies files and folders to skip during synchronization at login and logout:

- Use the **Skip items that start with** policy to skip items that start with the specified string.
The string should not contain the slash (/) character.
- Use the **Skip items that end with** policy to skip items that end with the specified string.
The string should not contain the slash (/) character.
- Use the **Skip items whose name contains** policy to skip items that contain the specified string.
The string should not contain the slash (/) character.
- Use the **Skip items whose name is** policy to skip items that exactly match the specified string.
The string should not contain the slash (/) character.
- Use the **Skip items whose full path is** policy to skip all items in the specified directory.

For example, if you specify ~/Library, no items in ~/Library directory will be synchronized. Note that this policy applies to all items in the specified directory, but *not* to items in subdirectories. To skip items in subdirectories, either explicitly add the subdirectories; for example:

~/Library/Caches, ~/Library/Logs

or use the next policy, **Skip items whose partial path matches**, which will skip items in any directory whose path includes the specified string.

- Use the **Skip items whose partial path matches** policy to skip items with a partial path that matches the specified string. For example,

`~/Library`

skips items in `~/Library` and in all its subdirectories; or:

`~/Caches`

skips items in `~/Library/Caches`, `~/Users/jrich/Caches`, and so on.

If you enable any of these group policies, click **Add** and type a string, for example `users` or `/Users,~/Library`, then click **OK**.

These policies require the [Enable/disable login & logout synchronization rules](#) policy to be enabled.

Note When the Access Manager console is running on Windows 2000 SP4 or Windows 2003, this policy cannot be set to disabled. This problem is corrected if Service Pack 1 or later is applied to the computer on which the Access Manager console is running.

Once any of these policies are enabled, they take effect when users log out and log back in.

Setting synchronization rules for manual or automatic synchronization

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings > Synchronization Rules: Options

Description

Use the group policy in the **Synchronization Rules: Options** category to specify when to synchronize folders in the background. You can choose to synchronize folders manually or automatically at a specific interval. Group policies in this category correspond to settings you make by opening Mobility

preferences, clicking Rules, then clicking the Options pane in the Workgroup Manager.

Manually/automatically synchronize background folders

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Legacy Settings > Synchronization Rules: Options >
Manually/automatically synchronize background folders

Description

Select whether background synchronization for mobile user accounts should be initiated manually or automatically at a set interval. If you enable this group policy, select whether synchronization should be initiated **automatically** or **manually**.

If you initiate background synchronization automatically, you can also specify how frequently folders should be synchronized. You can set frequency from every 5 minutes to every 60 minutes. The default interval is 20 minutes.

In setting the background synchronization interval, you should take into account the network bandwidth and the number of concurrent users the Mac OS X server supports. If you set background synchronization to occur at a short interval, such as every 5 minutes, and there are many concurrent users, you may overload the server. For example, the server may become backlogged by the too-frequent comparison of file modification dates. If you set background synchronization to occur less frequently, for example every 60 minutes, users may load older, outdated files. For example, if a user saves changes to a file and logs off before files are synchronized at the next interval, when the user loads that same file on another computer, he may get an older version of the file or no file at all.

Once enabled, this group policy takes effect when users log out and log back in.

Mobility Mac OS X 10.5 Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.5 Settings

Description

If your environment does not contain Mac OS X 10.5 computers, you can ignore the group policies in this folder.

Mobility Mac OS X 10.6 Settings

If your environment does not contain Mac OS X 10.6 computers, you can ignore the group policies in this folder.

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.6 Settings

Description

Mobility Mac OS X 10.7 Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings

Description

The Mac OS X 10.7 Settings allow you to configure mobility synchronization policies that apply specifically to Mac OS X 10.7 computers. Because the user interface varies between Mac OS X releases, Centrify provides separate policies for each release. See [Mobility Legacy Settings](#) for older versions of Mac OS X.

If your environment does not contain Mac OS X 10.7 computers, you can ignore these settings.

Configure mobile account creation (10.7)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Configure mobile account creation

Description

Use this policy to configure mobile account creation.

Check **Create mobile account when user logs in to network account** to create a mobile account automatically when a user logs in. A local home folder is created for the user at first login.

To prevent creation of a mobile account, enable the policy and deselect this option. A local home folder is not created for a user who is logged in as a network user.

Note If you do not enable this policy, and you allow access to the Accounts pane of System Preferences, network users can create their own mobile accounts.

Check the **Create mobile account even if user does not have a network home directory** option to create mobile accounts automatically for users the next time they log in to the Mac. This applies to all users, including users who do not have a network home directory.

Check **Require confirmation before creating mobile account** to allow users to decide whether to enable a mobile account at login. Users see a confirmation dialog when logging in and can click one of the following:

- “Create Now” to create a local home folder and enable the mobile account.
- “Don't Create” to log in as a network user without enabling the mobile account.
- “Cancel Login” to return to the login window.

Select **Show “Don't ask me again” checkbox** to provide a check box that allows users to prevent display of the mobile account creation dialog on that computer in the future. Users who select “Don't ask me again” and click “Don't Create”, are not asked to create a mobile account on that computer (unless they hold down the Option key during login to redisplay the dialog). Select one of the **Create home** options:

- Select **network home and default sync settings** to initially sync local and network homes so that the network home folder replaces the local home folder.
The default Mac sync settings in the Accounts pane of System Preferences are enabled.
- Select **local home template** to create the local home folder without syncing. The default Mac sync settings are enabled.

Once enabled, this group policy takes effect when users log out and back in.

Configure mobile account options (10.7)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Configure mobile account options

Description

Use this policy to specify options for mobile accounts, including FileVault settings and home folder location.

Note These options only apply to a new user being created at login and do not affect existing mobile users.

Select **Encrypt contents with FileVault** to encrypt the contents of the home directory.

Select one of the password options:

- Select **Use computer master password if available**
The mobile account uses FileVault regardless of whether a master password has been set. However, if a user forgets their password, an administrator will be unable to unlock the account.
- Select **Require computer master password** if a master password has not been set, the user will be unable to create a mobile account.

To prevent the user's local home folder from using more space than is available in the user's network home folder, select **Restrict size** and enter a fixed size for the home folder.

Select a location for the home folder or allow users to choose, by using the pull-down menu in **Home folder location**. To choose a location, select one of the following:

- **on startup volume** — The local home folder is created in `/Users/username` on the startup volume.
- **at path specified below** — Specify a different volume or folder in the **Path** field, using the format:
`/Volumes/driveName/Folder` — for example:
`/Volumes:E/Users`

If you do not specify a volume, the folder is created on the startup volume.

To allow users to choose a location, select one of the following.

- **user chooses any volume | internal volume | external volume**—
When users with mobile accounts log in and a mobile account is being created, a window appears for choosing the location of the home folder.

Account Expiry (10.7)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Account Expiry

Description

The group policy in this folder enables you to specify whether, and when, to delete mobile accounts and folders.

Delete mobile accounts automatically

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Account Expiry > Delete mobile accounts automatically

Description

Specify whether to delete mobile accounts and their local home folders automatically after a specified period of inactivity.

Typically, Mac OS X creates a local home folder on each computer on which a user enables a mobile account. If a user stops using one or more of these computers, these local home folders create clutter and unnecessarily consume disk space.

If you enable this policy, a mobile account and its local home folder are deleted after the specified period of inactivity.

Set the expiration to 0 to delete the mobile account and its local home folder immediately after the user logs out.

Enter the following information:

- **Time:** The number of hours, days, or weeks (specified in **Time Unit**) Period of inactivity that triggers deletion of mobile accounts and their associated local home folders.
- **Time Unit:** Select hours, days, or weeks as the type of unit for the number specified in **Time**.
- **Delete only after successful sync:** Select this option to wait to delete the account and folder until after the account has been synced.

This policy does not delete external accounts, that is, accounts with local home folders on an external drive.

Once enabled, this group policy takes effect when users log out and log back in.

Synchronization Rules (10.7)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Synchronization Rules

Description

Use the group policies in the **Synchronization Rules** folder to specify rules for synchronizing folders for mobile users, as follows:

- Specify the folders to synchronize in the background. These group policies are located in the **Home Sync** folder.
- Specify the folders to synchronize at login and logout. These group policies are located in the **Options** folder.
- Specify whether to synchronize background folders manually, or automatically at a specific interval. These group policies are located in the **Preference Sync** folder.

You can also use the **Skip these items** group policies to define criteria for folders that should not be synchronized in the background or when mobile users login and logout.

If a file in one home folder has been modified and the same file in another home folder has not, the newer file overwrites the older file. If both files have been modified since the last sync, the user is prompted to choose which file to keep.

Administrators can enable and configure syncing through group policy, and users can configure syncing through Accounts preferences. With group policy, you can sync any folder in a user's home folder. However, a user who creates a mobile account through the Accounts System Preferences can only sync top-level folders like ~/Desktop or ~/Documents.

It is not recommended to use background syncing with folders containing files accessed by multiple computers because it is easy to inadvertently load older, un-synced files.

Be careful with Login and logout syncing because a user's login and logout is delayed while files are syncing. Therefore, avoid syncing a lot of files or large files at login and logout. One strategy is to sync smaller files (such as preference files) at login and logout, while syncing larger files (such as movies) in the background. Or, you can further reduce network traffic by choosing not to sync the movies folder at all, requiring users to access the movies folder locally.

Note If you want to sync parts of a user's ~/Library folder, you must use login and logout syncing. Syncing the ~/Library folder retains user's bookmarks and application preferences.

See your Mac OS X Server documentation for more details about synchronizing mobile accounts.

Enable home sync rules

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Synchronization Rules > Home Sync >

Enable home sync rules

Description

Enable this policy to configure home sync rules. This policy is found in the Home Sync folder.

This policy is used for files in the user's home folder (~), but not for ~/Library.

To configure home sync, enable this policy and select one or more of the following sync options:

- **at login** Sync files when a mobile user logs in.
- **at logout** Sync files when a mobile user logs out.
- **in the background** Sync files in the background at the interval specified by the [Manually/automatically sync in the background](#) policy.
- **manually** Allow users to sync manually.

Deselect any of these options to prevent that type of syncing. For example, deselect **manually** to prevent users from syncing manually.

To stop mobile accounts from syncing files entirely, you must enable this policy and deselect all options. You also need to set the [Manually/automatically sync in the background](#) policy to "Not Configured" or "Disabled".

If you don't manage these policies, users' current sync settings remain in effect and users can choose their sync settings in the Accounts pane of System Preferences.

You also need to set the **Synchronize items** > [Synchronize home sync items](#) policy to Not Configured or Disabled.

Select **Merge with user's settings** to add synced folders to folders the user selects for syncing,

If you sync the same folder in group policy as the user chooses in the Accounts pane of System Preferences, merging causes the group policy sync settings to take precedence. If you do not select **Merge with user's settings**, the folders you sync replace those chosen by the user.

Once enabled, this group policy takes effect when users log out and back in.

Skip these items

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Synchronization Rules > Home Sync > Skip these items

Description

These group policies are located in the **Skip Items** folder.

Set the criteria to identify folders that should not be synchronized in the background for users with mobile accounts. These group policies allow you to specify a string that identifies files and folders to skip during synchronization:

- Use the **Skip items that end with** policy to skip items that end with the specified string. The string should not contain the slash (/) character.
- Use the **Skip items that start with** policy to skip items that start with the specified string. The string should not contain the slash (/) character.
- Use the **Skip items whose full path matches** policy to skip all items in the specified directory. For example, if you specify ~/Library, no items in ~/Library directory will be synchronized.
- Use the **Skip items whose name contains** policy to skip items that contain the specified string. The string should not contain the slash (/) character.
- Use the **Skip items whose name is** policy to skip items that exactly match the specified string. The string should not contain the slash (/) character.
- Use the **Skip items whose partial path matches** policy to skip items with a partial path that matches the specified string.
- Use the **Skip items whose RegEx name is** policy to skip items whose name exactly matches the specified RegEx string.
- Use the **Skip items whose RegEx path is** policy to skip all items whose path matches the specified RegEx string.

• • • • •

Enable any of these group policies, then click **Add** and type a string, for example `users` or `/Users,~/Library`, then click **OK**.

These policies require the [Enable preference sync rules](#) policy to be enabled.

After any of these policies are enabled, they take effect when users log out and log back in.

Synchronize home sync items

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Synchronization Rules > Home Sync > Synchronize items > Synchronize home sync items

Description

This group policy is located in the **Synchronize Items** folder.

Enable this group policy to choose folders to sync.

To specify a folder, click **Add** and enter the folder name, then click **OK**.

Precede the folder with `~/` to specify the location of the synced folder in the user's home folder. For example, to sync the user's Documents folder, enter `~/Documents`.

This policy is for syncing user's data. Do not sync `~/Library`, `~/Documents/Microsoft User Data`, or any of their sub-folders in the background, as they cannot be synced correctly.

Once enabled, this group policy takes effect when users log out and back in.

Enable preference sync rules

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Synchronization Rules > Preference Sync

Description

Configure preference sync rules.

This policy configures options for syncing preference files, which are typically stored in ~/Library.

To configure preference sync, enable this policy and select one or more of the following sync options:

- **at login** Sync files when a mobile user logs in.
- **at logout** Sync files when a mobile user logs out.
- **in the background** Sync files in the background at the interval specified by the [Manually/automatically sync in the background](#) policy.
- **manually** Allow users to sync manually.

Deselect any of these options to prevent that type of syncing. For example, deselect **manually** to prevent users from syncing manually.

To stop mobile accounts from syncing files entirely, you must enable this policy and deselect all options. You also need to set the [Manually/automatically sync in the background](#) policy to “Not Configured” or “Disabled”.

If you don't manage these policies, users' current sync settings remain in effect and users can choose their sync settings in the Accounts pane of System Preferences.

To add synced folders to folders the user selects for syncing, select **Merge with user's settings**.

If you sync the same folder in group policy as the user chooses in the Accounts pane of System Preferences, merging causes the group policy sync

• • • • •

settings to take precedence. If you do not select **Merge with user's settings**, the folders you sync replace those chosen by the user.

Once enabled, this group policy takes effect when users log out and back in.

Skip these items

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Synchronization Rules > Preference Sync > Skip these items

Description

Set the criteria to identify preference folders that should not be synchronized for users with mobile accounts. These group policies allow you to specify a string that identifies files and folders to skip during synchronization:

- Use the **Skip items that end with** policy to skip items that end with the specified string. The string should not contain the slash (/) character.
- Use the **Skip items that start with** policy to skip items that start with the specified string. The string should not contain the slash (/) character.
- Use the **Skip items whose full path matches** policy to skip all items in the specified directory. For example, if you specify ~/Library, no items in ~/Library directory will be synchronized.
- Use the **Skip items whose name contains** policy to skip items that contain the specified string. The string should not contain the slash (/) character.
- Use the **Skip items whose name is** policy to skip items that exactly match the specified string. The string should not contain the slash (/) character.
- Use the **Skip items whose partial path matches** policy to skip items with a partial path that matches the specified string.

- Use the **Skip items whose RegEx name is** policy to skip items whose name exactly matches the specified RegEx string.
- Use the **Skip items whose RegEx path is** policy to skip all items whose path matches the specified RegEx string.

Enable any of these group policies, then click **Add** and type a string, for example `users` or `/Users,~/Library`, then click **OK**.

These policies require the [Enable preference sync rules](#) policy to be enabled.

Once any of these policies are enabled, they take effect when users log out and log back in.

Sync preference sync items

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Synchronization Rules > Preference Sync > Synchronize items

Description

Enable this group policy to choose folders to sync in the user's home folder.

To specify a folder, click **Add** and enter the folder name, then click **OK**.

Precede the folder with `~/` to specify the location of the synced folder in the user's home folder. For example, to sync the user's Library folder, enter `~/Library`.

This policy is for syncing user's preferences and settings. Do not sync folders outside `~/Library` and `~/Documents/Microsoft User Data` at login and logout, as they cannot be synced correctly.

Once enabled, this group policy takes effect when users log out and back in.

Manually/automatically sync in the background

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings > Synchronization Rules > Options > Manually/automatically sync in the background

Description

Select whether background synchronization for mobile user accounts should be initiated manually or automatically at a set interval. If you enable this group policy, select whether synchronization should be initiated **automatically** or **manually**.

If you initiate background synchronization automatically, you can also specify how frequently folders should be synchronized. You can set frequency from every 5 minutes to every 8 hours. The default interval is 20 minutes.

In setting the background synchronization interval, you should take into account the network bandwidth and the number of concurrent users the Mac OS X server supports. If you set background synchronization to occur at a short interval, such as every 5 minutes, and there are many concurrent users, you may overload the server. For example, the server may become backlogged by the too-frequent comparison of file modification dates. If you set background synchronization to occur less frequently, for example every 60 minutes, users may load older, outdated files. For example, if a user saves changes to a file and logs off before files are synchronized at the next interval, when the user loads that same file on another computer, he may get an older version of the file or no file at all.

Select **Show status in menu bar** to display a mobile account status menu on mobile account user's menu bar. This menu allows users to do the following:

- View the last time they synced
- Manually start a sync
- Edit their home sync preferences

Note If you do not enable the sync status menu bar, users can still manage their home sync preferences through the Accounts pane of System preferences. However, if you manage any mobility settings through group policy, users cannot change those home sync preferences.

Once enabled, this group policy takes effect when users log out and log back in.

Mobility Mac OS X 10.8 to 10.11 Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings

Description

The Mac OS X 10.8 to 10.11 Settings allow you to configure mobility synchronization policies that apply specifically to Mac OS X releases 10.8 to 10.11. Because the user interface varies between Mac OS X releases, Centrify provides separate policies for each release. See [Mobility Legacy Settings](#) for older versions of Mac OS X.

If your environment does not contain Mac OS X 10.8 to 10.11 computers, you can ignore these settings.

Note The mobile account options specified by this policy apply only to new mobile users who are created during login. This policy does not affect existing mobile users.

Configure mobile account creation (10.8 to 10.11)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings > Configure mobile account creation

Description

Use this policy to configure mobile account creation.

Check **Create mobile account when user logs in to network account** to create a mobile account automatically when a user logs in. A local home folder is created for the user at first login.

To prevent creation of a mobile account, enable the policy and deselect this option. A local home folder is not created for a user who is logged in as a network user.

Note If you do not enable this policy, and you allow access to the Accounts pane of System Preferences, network users can create their own mobile accounts.

Check the **Create mobile account even if user does not have a network home directory** option to create mobile accounts automatically for users the next time they log in to the Mac. This applies to all users, including users who do not have a network home directory.

Check **Require confirmation before creating mobile account** to allow users to decide whether to enable a mobile account at login. Users see a confirmation dialog when logging in and can click one of the following:

- “Create Now” to create a local home folder and enable the mobile account.
- “Don't Create” to log in as a network user without enabling the mobile account.
- “Cancel Login” to return to the login window.

Select **Show “Don't ask me again” checkbox** to provide a check box that allows users to prevent display of the mobile account creation dialog on that computer in the future. Users who select “Don't ask me again” and click “Don't Create”, are not asked to create a mobile account on that computer (unless they hold down the Option key during login to redisplay the dialog). Select one of the **Create home** options:

- Select **network home and default sync settings** to initially sync local and network homes so that the network home folder replaces the local home folder.

• • • • •

The default Mac sync settings in the Accounts pane of System Preferences are enabled.

- Select **local home template** to create the local home folder without syncing.

The default Mac sync settings are enabled.

Once enabled, this group policy takes effect when users log out and back in.

Configure mobile account options (10.8 to 10.11)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings > Configure mobile account options

Description

Specify options for mobile accounts, including FileVault settings and home folder location.

Note These options only apply to a new user being created at login and do not affect existing mobile users.

Select **Encrypt contents with FileVault** to encrypt the contents of the home directory.

Select one of the password options:

- Select **Use computer master password if available**
The mobile account uses FileVault regardless of whether a master password has been set. However, if a user forgets their password, an administrator will be unable to unlock the account.
- Select **Require computer master password** If a master password has not been set, the user will be unable to create a mobile account.

To prevent the user's local home folder from using more space than is available in the user's network home folder, select **Restrict size** and enter a fixed size for the home folder.

Select a location for the home folder or allow users to choose, by using the pull-down menu in **Home folder location**. To choose a location, select one of the following:

- **on startup volume** — The local home folder is created in `/Users/username` on the startup volume.
- **at path specified below** — Specify a different volume or folder in the **Path** field, using the format:

`/Volumes/driveName/Folder` — for example:
`/Volumes:E/Users`

If you do not specify a volume, the folder is created on the startup volume.

To allow users to choose a location, select one of the following.

- **user chooses any volume | internal volume | external volume**—
 When users with mobile accounts log in and a mobile account is being created, a window appears for choosing the location of the home folder.

Account Expiry (10.8 and above)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings > Account Expiry

Description

The group policy in this folder enables you to specify whether, and when, to delete mobile accounts and folders.

Delete mobile accounts automatically

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings > Account Expiry > Delete mobile accounts automatically

Description

Specify whether to delete mobile accounts and their local home folders automatically after a specified period of inactivity.

Typically, Mac OS X creates a local home folder on each computer on which a user enables a mobile account. If a user stops using one or more of these computers, these local home folders create clutter and unnecessarily consume disk space.

If you enable this policy, a mobile account and its local home folder are deleted after the specified period of inactivity.

Set the expiration to 0 to delete the mobile account and its local home folder immediately after the user logs out.

Enter the following information:

- **Time:** The number of hours, days, or weeks (specified in **Time Unit**) Period of inactivity that triggers deletion of mobile accounts and their associated local home folders.
- **Time Unit:** Select hours, days, or weeks as the type of unit for the number specified in **Time**.
- **Delete only after successful sync:** Select this option to wait to delete the account and folder until after the account has been synced.

This policy does not delete external accounts, that is, accounts with local home folders on an external drive.

Once enabled, this group policy takes effect when users log out and log back in.

Synchronization Rules (10.8 to 10.11)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings > Synchronization Rules

Description

Use the group policies in the **Synchronization Rules** folder to specify rules for synchronizing folders for mobile users, as follows:

- Specify the folders to synchronize in the background. These group policies are located in the **Home Sync** folder.
- Specify the folders to synchronize at login and logout. These group policies are located in the **Options** folder.
- Specify whether to synchronize background folders manually, or automatically at a specific interval. These group policies are located in the **Preference Sync** folder.

You can also use the **Skip these items** group policies to define criteria for folders that should not be synchronized in the background or when mobile users login and logout.

Understanding synchronization

This section explains some aspects of synchronization to keep in mind when enabling synchronization policies.

If a file in one home folder has been modified and the same file in another home folder has not, the newer file overwrites the older file. If both files have been modified since the last sync, the user is prompted to choose which file to keep.

Administrators can enable and configure syncing through group policy, and users can configure syncing through Accounts preferences. With group policy, you can sync any folder in a user's home folder. However, a user who creates

• • • • •

a mobile account through the Accounts System Preferences can only sync top-level folders like ~/Desktop or ~/Documents.

It is not recommended to use background syncing with folders containing files accessed by multiple computers because it is easy to inadvertently load older, un-synced files.

Be careful with Login and logout syncing because a user's login and logout is delayed while files are syncing. Therefore, avoid syncing a lot of files or large files at login and logout. One strategy is to sync smaller files (such as preference files) at login and logout, while syncing larger files (such as movies) in the background. Or, you can further reduce network traffic by choosing not to sync the movies folder at all, requiring users to access the movies folder locally.

Note If you want to sync parts of a user's ~/Library folder, you must use login and logout syncing. Syncing the ~/Library folder retains user's bookmarks and application preferences.

See your Mac OS X Server documentation for more details about synchronizing mobile accounts.

Enable home sync rules

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings > Synchronization Rules > Home Sync > Enable home sync rules

Description

Enable this policy to configure home sync rules. This policy is found in the Home Sync folder.

This policy is used for files in the user's home folder (~), but not for ~/Library.

To configure home sync, enable this policy and select one or more of the following sync options:

- **at login** Sync files when a mobile user logs in.
- **at logout** Sync files when a mobile user logs out.
- **in the background** Sync files in the background at the interval specified by the [Manually/automatically sync in the background](#) policy.
- **manually** Allow users to sync manually.

Deselect any of these options to prevent that type of syncing. For example, deselect **manually** to prevent users from syncing manually.

To stop mobile accounts from syncing files entirely, you must enable this policy and deselect all options. You also need to set the [Manually/automatically sync in the background](#) policy to “Not Configured” or “Disabled”.

If you don't manage these policies, users' current sync settings remain in effect and users can choose their sync settings in the Accounts pane of System Preferences.

You also need to set the **Synchronize items** > [Synchronize home sync items](#) policy to Not Configured or Disabled.

Select **Merge with user's settings** to add synced folders to folders the user selects for syncing,

If you sync the same folder in group policy as the user chooses in the Accounts pane of System Preferences, merging causes the group policy sync settings to take precedence. If you do not select **Merge with user's settings**, the folders you sync replace those chosen by the user.

Once enabled, this group policy takes effect when users log out and back in.

Synchronize home sync items

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings > Synchronization Rules >

Synchronize items > Synchronize home sync items

Description

Enable this group policy to choose folders to sync. This group policy is located in the Synchronize Items folder.

To specify a folder, click **Add** and enter the folder name, then click **OK**.

Precede the folder with ~/ to specify the location of the synced folder in the user's home folder. For example, to sync the user's Documents folder, enter ~/Documents.

This policy is for syncing user's data. Do not sync ~/Library, ~/Documents/Microsoft User Data, or any of their sub-folders in the background, as they cannot be synced correctly.

Once enabled, this group policy takes effect when users log out and back in.

Enable preference sync rules

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings > Preference Sync > Enable preference sync rules

Description

Configure preference sync rules. This policy is found in the Preference Sync folder.

This policy configures options for syncing preference files, which are typically stored in ~/Library.

To configure preference sync, enable this policy and select one or more of the following sync options:

- **at login** Sync files when a mobile user logs in.
- **at logout** Sync files when a mobile user logs out.
- **in the background** Sync files in the background at the interval specified by the [Manually/automatically sync in the background](#) policy.
- **manually** Allow users to sync manually.

Deselect any of these options to prevent that type of syncing. For example, deselect **manually** to prevent users from syncing manually.

To stop mobile accounts from syncing files entirely, you must enable this policy and deselect all options. You also need to set the [Manually/automatically sync in the background](#) policy to “Not Configured” or “Disabled”.

If you don't manage these policies, users' current sync settings remain in effect and users can choose their sync settings in the Accounts pane of System Preferences.

To add synced folders to folders the user selects for syncing, select **Merge with user's settings**.

If you sync the same folder in group policy as the user chooses in the Accounts pane of System Preferences, merging causes the group policy sync settings to take precedence. If you do not select **Merge with user's settings**, the folders you sync replace those chosen by the user.

Once enabled, this group policy takes effect when users log out and back in.

Synchronize preference sync items

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings > Synchronization Rules > Preference Sync > Synchronize items > Synchronize preference sync items

Description

Enable this group policy to choose folders to sync in the user's home folder. This group policy is located in the Synchronize Items folder.

To specify a folder, click **Add** and enter the folder name, then click **OK**.

Precede the folder with ~/ to specify the location of the synced folder in the user's home folder. For example, to sync the user's Library folder, enter ~/Library.

This policy is for syncing user's preferences and settings. Do not sync folders outside ~/Library and ~/Documents/Microsoft User Data at login and logout, as they cannot be synced correctly.

Once enabled, this group policy takes effect when users log out and back in.

Setting options for manual or automatic synchronization rules

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.8 to 10.11 Settings > Synchronization Rules > Options

Description

To specify rules for synchronizing folders manually or automatically in the background and at what interval, set the following group policy, which is located in the **Synchronization Rules: Options** folder.

Manually/automatically sync in the background

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > Mac OS X 10.7 Settings > Synchronization Rules > Options >

Manually/automatically sync in the background

Description

This group policy is located in the Synchronization Rules: Options folder.

Select whether background synchronization for mobile user accounts should be initiated manually or automatically at a set interval. If you enable this group policy, select whether synchronization should be initiated **automatically** or **manually**.

If you initiate background synchronization automatically, you can also specify how frequently folders should be synchronized. You can set frequency from every 5 minutes to every 8 hours. The default interval is 20 minutes.

In setting the background synchronization interval, you should take into account the network bandwidth and the number of concurrent users the Mac OS X server supports. If you set background synchronization to occur at a short interval, such as every 5 minutes, and there are many concurrent users, you may overload the server. For example, the server may become backlogged by the too-frequent comparison of file modification dates. If you set background synchronization to occur less frequently, for example every 60 minutes, users may load older, outdated files. For example, if a user saves changes to a file and logs off before files are synchronized at the next interval, when the user loads that same file on another computer, he may get an older version of the file or no file at all.

Select **Show status in menu bar** to display a mobile account status menu on mobile account user's menu bar. This menu allows users to do the following:

- View the last time they synced
- Manually start a sync
- Edit their home sync preferences

Note If you do not enable the sync status menu bar, users can still manage their home sync preferences through the Accounts pane of System preferences. However, if you manage any mobility settings through group policy, users cannot change those home sync preferences.

Once enabled, this group policy takes effect when users log out and log back in.

Mobility macOS 10.12 or above Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > macOS 10.12 or above

Description

The macOS 10.12 or above Settings allow you to configure mobility synchronization policies that apply specifically to Mac OS X releases macOS 10.12 or above. Because the user interface varies between Mac OS X releases, Centrify provides separate policies for each release. See [Mobility Legacy Settings](#) for older versions of Mac OS X.

If your environment does not contain macOS 10.12 or above computers, you can ignore these settings.

Configure mobile account creation

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > macOS 10.12 or above > Configure mobile account creation

Description

Configure whether mobile accounts are created when users log in.

Check **Create mobile account when user logs in to network account** to create a mobile account automatically when a user logs in. A local home folder is created for the user at first login.

To prevent creation of a mobile account, enable the policy and deselect this option. A local home folder is not created for a user who is logged in as a network user.

Note If you do not enable this policy, and you allow access to the Accounts pane of System Preferences, network users can create their own mobile accounts.

Check the **Create mobile account even if user does not have a network home directory** option to create mobile accounts automatically for users the next time they log in to the Mac. This applies to all users, including users who do not have a network home directory.

Check **Require confirmation before creating mobile account** to allow users to decide whether to enable a mobile account at login. Users see a confirmation dialog when logging in and can click one of the following:

- “Create Now” to create a local home folder and enable the mobile account.
- “Don't Create” to log in as a network user without enabling the mobile account.
- “Cancel Login” to return to the login window.

Select **Show “Don't ask me again” checkbox** to provide a check box that allows users to prevent display of the mobile account creation dialog on that computer in the future. Users who select “Don't ask me again” and click “Don't Create”, are not asked to create a mobile account on that computer (unless they hold down the Option key during login to redisplay the dialog). Select one of the **Create home** options:

- Select **network home and default sync settings** to initially sync local and network homes so that the network home folder replaces the local home folder. The default Mac sync settings in the Accounts pane of System Preferences are enabled.
- Select **local home template** to create the local home folder without syncing. The default Mac sync settings are enabled.

Once enabled, this group policy takes effect when users log out and back in.

Configure mobile account options

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > macOS 10.12 or above > Configure mobile account options

Description

Specify options for mobile accounts, including FileVault settings and home folder location.

Note These options only apply to a new user being created at login and do not affect existing mobile users.

Select **Encrypt contents with FileVault** to encrypt the contents of the home directory.

Note With macOS 10.13 and later Apple no longer supports FileVault settings on just the mobile account home directory. Please use the FileVault 2 settings in Computer Configuration > Centrify Settings > Mac OS X Settings > Security and Privacy > FileVault 2.

Select one of the password options:

- Select **Use computer master password if available**
The mobile account uses FileVault regardless of whether a master password has been set. However, if a user forgets their password, an administrator will be unable to unlock the account.
- Select **Require computer master password** If a master password has not been set, the user will be unable to create a mobile account.

To prevent the user's local home folder from using more space than is available in the user's network home folder, select **Restrict size** and enter a fixed size for the home folder.

Select a location for the home folder or allow users to choose, by using the pull-down menu in **Home folder location**. To choose a location, select one of the following:

- **on startup volume** — The local home folder is created in `/Users/username` on the startup volume.
- **at path specified below** — Specify a different volume or folder in the **Path** field, using the format:

`/Volumes/driveName/Folder` — for example:
`/Volumes:E/Users`

If you do not specify a volume, the folder is created on the startup volume.

To allow users to choose a location, select one of the following.

- **user chooses any volume | internal volume | external volume**—
 When users with mobile accounts log in and a mobile account is being created, a window appears for choosing the location of the home folder.

Account Expiry (10.12 and above)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > macOS 10.12 or above > Account Expiry

Description

The group policy in this folder enables you to specify whether, and when, to delete mobile accounts and folders.

Delete mobile accounts automatically

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Mobility Settings > macOS 10.12 or above > Account Expiry > Delete mobile accounts automatically

Description

Specify whether to delete mobile accounts and their local home folders automatically after a specified period of inactivity.

Typically, macOS creates a local home folder on each computer on which a user enables a mobile account. If a user stops using one or more of these computers, these local home folders create clutter and unnecessarily consume disk space.

If you enable this policy, a mobile account and its local home folder are deleted after the specified period of inactivity.

Set the expiration to 0 to delete the mobile account and its local home folder immediately after the user logs out.

Enter the following information:

- **Time:** The number of hours, days, or weeks (specified in **Time Unit**) Period of inactivity that triggers deletion of mobile accounts and their associated local home folders.
- **Time Unit:** Select hours, days, or weeks as the type of unit for the number specified in **Time**.
- **Delete only after successful sync:** Select this option to wait to delete the account and folder until after the account has been synced.

This policy does not delete external accounts, that is, accounts with local home folders on an external drive.

Once enabled, this group policy takes effect when users log out and log back in.

Printing settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Printing Settings > Specify printer list (with model)

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Printing Settings > Specify printer list (with model)** group policy to specify a list of printers for a user.

The printers that are available to a user are a combination of those specified in this policy and those added through System Preferences on the local computer. Note that this policy allows an administrator to control whether the user can add or see printers on the local computer, or is only allowed to use the managed printers specified by this policy.

Specify a managed list of network printers that are available to a user on this computer. Printers specified by this policy use a generic PostScript driver.

To add a printer, click **Add** and enter the following information:

- **Name:** A name of your choosing for the printer.
- **DeviceURI:** The device Uniform Resource Identifier, which specifies the device that is assigned to the printer (see [Specifying the device URI](#)); for example:
 - `socket://192.168.0.20:9100` (which identifies the protocol, IP address, and port number)
 - `cdcsmb://dc1.acme.com/HPLaserJet2` (which identifies a Windows printer added using the Centrify protocol and identified by hostname.)
- (Optional) **Model:** The printer driver for the printer model (see [Specifying the model \(printer driver\)](#)); for example: `HP Photosmart C6100 series. Fax`

You can use the following options to control access to the printers on the local computer:

- **Allow user to modify the printer list:** Check this option to allow local users to make changes in System Preferences to the printers that have been added by this policy, including deleting them.
Deselect this option to prevent local users from modifying the printers added by this policy.
- **Allow printers that connect directly to user's computer:** Check this option to allow users to add their own local printers.

Deselect this option to prevent users from adding local printers.

- **Require an administrator password:** Check this option to require an administrator's password when adding local printers.
- **Only show managed printers:** Check this option to allow local users to use only the managed printers specified by this option.

Printers added locally, for example, through System Preferences, will not be visible.

Deselect this option to allow local users to use printers added locally, as well as the managed printers added by this policy.

Printers added through this group policy appear after the next group policy refresh interval.

Specifying the device URI

When you add a printer through the **Specify printer list** group policy, or locally by using the **Print & Scan, Add Printer** advanced options, the printer is implemented through the Common UNIX Printing System (CUPS), which was developed by Apple for Mac OS X and other UNIX-like operating systems.

The CUPS system supports the following device Uniform Resource Identifier (URI) protocols that you can use to specify the printers to add.

AppSocket or Jetdirect protocol

The AppSocket, or JetDirect, protocol normally prints over port 9100 and uses the socket URI scheme:

```
socket://ip-address-or-hostname
```

```
socket://ip-address-or-hostname:port-number
```

Internet Printing Protocol (IPP)

CUPS supports IPP natively. IPP printing normally happens over port 631 and uses the http and ipp URI schemes:

```
ipp://ip-address-or-hostname/resource
```

.....

```
ipp://ip-address-or-hostname:port-number/resource
```

```
http://ip-address-or-hostname:port-number/resource
```

Line printer daemon protocol (LPD)

LPD is the original network printing protocol and is supported by many network printers. LPD printing normally happens over port 515 and uses the lpd URI scheme:

```
lpd://ip-address-or-hostname/queue
```

```
lpd://username@ip-address-or-hostname/queue
```

Windows Printer via Centrify

When Mac users print on a Windows network printer, they must authenticate separately. Specifying a Windows printer via Centrify allows users to access the printer without providing credentials as they have already been authenticated through Active Directory.

Centrify printing normally happens over port 445 and uses the cdcsmb URI scheme:

```
cdcsmb://server_fqdn/printersharename
```

Windows

Windows printing normally happens over port 445 and uses the smb URI scheme:

Note You can use the Centrify protocol (cdcsmb), if you want to use Windows network printers without providing credentials each time.

```
smb://workgroup/server/printersharename
```

```
smb://ip-address-or-hostname/printersharename
```

```
smb://username:password@workgroup/ip-address-or-hostname/printersharename
```

.....

```
smb://username:password@ip-address-or-  
hostname/printersharename
```

Specifying the model (printer driver)

Model specifies the model name of the added printer and is used to determine which device driver to associate with the printer. Be certain to specify model correctly, otherwise, if model is not specified, or does not match a driver installed on the client Mac OS X computer, Generic PostScript driver will be selected for the printer, which may result in fewer printing options.

To find the correct model name, take one of these two approaches:

Use Printers & Scanners to identify the model:

1. On a Mac OS X computer, open **System Preferences > Printers & Scanners**.
2. Click **Add (+)** to add a printer.
3. When you select a printer, the correct model name appears on the "Use" drop down menu.

Use lpinfo to identify the model

1. On a Mac OS X computer, open the Terminal application.
2. Run the following command to obtain the list of all the models available:

```
"lpinfo -m" command
```

In the output from `lpinfo`, the correct model string appears right after `*.ppd.gz`. For example:

```
Library/Printers/PPDs/Contents/Resources/HP Photosmart  
C6100 Series Fax.ppd.gz HP Photosmart C6100 series. Fax
```

The model string is:

```
HP Photosmart C6100 series. Fax
```

3. Type this in the group policy's **Model** field.

Scripts (Login/Logout)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Scripts (Login/Logout)

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > Scripts (Login/Logout)** group policies to deploy login and logout scripts that run when an Active Directory user logs on or logs out. When you use these group policies, the login and logout scripts are stored in the Active Directory domain's system volume (sysvol) and transferred to the Mac computer when the group policies are applied. Login and logout scripts are useful for performing common tasks such as mounting and un-mounting shares.

Note When these group policies are enabled, the first login by an AD user will restart the login script and return the user to the login window. Subsequent logins by this user or a different user occur normally and the changes generated by the script happen immediately.

Specify login script (Deprecated)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Scripts (Login/Logout) > Specify login script

Description

Specify the name of a login script to execute when users log on. You can specify only one file as the login script.

.....

Before enabling this policy, you should create the login script and copy it to the system volume (sysvol) on the domain controller. By default, the login script is stored in the system volume (SYSVOL) on the domain controller in the directory:

```
\\domain\SYSVOL\domain\Scripts\scriptname
```

The script path you type in **Login script** is relative to `\\domain\SYSVOL\domain\scripts\`. For example, if the domain name is `ajax.org` and you enter a script name of `mlogin.sh`, the script that gets executed on the domain controller is:

```
\\ajax.org\SYSVOL\ajax.org\Scripts\mlogin.sh
```

You can specify additional relative directories in the path, if needed.

Note Be certain authenticated users have permission to read this file so the script can run when they log in.

By default, the script runs with the Active Directory user's permissions. If the script contains commands that require root permission to run, select **Run with root user privileges**.

Once this group policy is enabled, it takes effect when users log out and log back in.

Note The first AD user to log in is taken back to the login screen. Subsequent logins by this user or a different user occur normally and changes generated by the script happen immediately.

Specify logout script

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Scripts (Login/Logout) > Specify logout script

Description

Specify the name of a logout script to execute when users log out. You can specify only one file as the logout script.

.....

Before enabling this policy, you should create the logout script and copy it to the system volume (SYSVOL) on the domain controller. By default, the logout script is stored in the system volume (SYSVOL) on the domain controller in the following directory:

```
\\domain\SYSVOL\domain\Scripts\scriptname
```

The script path you type in **Logout script** is relative to:

```
\\domain\SYSVOL\domain\scripts\.
```

For example, if the domain name is `ajax.org` and you enter a script name of `mlogout.sh`, the script that gets executed on the domain controller is:

```
\\ajax.org\SYSVOL\ajax.org\Scripts\mlogout.sh
```

Note Be certain authenticated users have permission to read this file so the script can run when they log out.

By default, the script runs with the Active Directory user's permissions. If the script contains commands that require root permission to run, select **Run with root user privileges**.

Once this group policy is enabled, it takes effect when users log out and log back in.

Specify multiple login scripts

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Scripts (Login/Logout) > Specify multiple login scripts

Description

Specify the names of one or more login scripts to execute when a user logs on. The scripts you specify run simultaneously in no particular order.

This policy is also available as a computer policy. If you specify scripts using both the computer and user policies, the computer scripts are executed first.

.....

Before enabling this policy, you should create the scripts and copy them to the system volume (sysvol) on the domain controller. By default, the login scripts are stored in the system volume (SYSVOL) on the domain controller in the directory:

```
\\domain\SYSVOL\domain\Scripts
\scriptname1
\scriptname2
...
```

After enabling this policy, click **Add** and enter the following information:

- **Script:** The name of the script and an optional path, which are relative to \\domain\SYSVOL\domain\scripts\.

For example, if the domain name is ajax.org and you enter a script name of mlogin.sh, the script that gets executed on the domain controller is:

```
\\ajax.org\SYSVOL\ajax.org\Scripts\mlogin.sh
```

You can specify additional relative directories in the path, if needed; for example, if you type sub\mlogin.sh, the file that gets executed is:

```
\\ajax.org\SYSVOL\ajax.org\Scripts\sub\mlogin.sh
```

- **Parameters:** An optional set of arguments to pass to the script.

These arguments are interpreted the same way as in a UNIX shell; that is, space is a delimiter, and backslash is an escape character. You can also use \$USER to represent the current user's name. For example:

```
arg1 arg2 arg3
arg1 'a r g 2' arg3
arg\' $USER.
```

Note Be certain authenticated users have permission to read these files so the scripts can run when they log in.

Once this group policy is enabled, it takes effect when users log out and log back in.

Security & Privacy Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy

Description

Use the Security & Privacy group policies to control user security and privacy settings.

Allow DoD Encryption Wizard to use smart card

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > Allow DoD Encryption Wizard to use smart card

Description

Enable this group policy to allow DoD Encryption Wizard to use smart cards.

Note that you have to enable smart card support for the DoD Encryption Wizard to access smart cards.

Once enabled, this policy can take effect dynamically at the next group policy refresh interval.

Allow NSSDB based applications to use smart card

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > Allow NSSDB based applications to use smart card

Description

Enable this group policy to allow NSSDB based applications to use smart card and add Firefox and Thunderbird to applications list.

Note This group policy should be enabled before enabling the NSSDB based applications allowed to use smart card group policy, otherwise, the settings in NSSDB based applications allowed to use smart card group policy will be overridden.

Note that you have to enable smart card support for NSSDB based applications to access a smart card.

Once enabled, this policy takes effect dynamically at the next group policy refresh interval.

NSSDB based applications allowed to use smart card

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > NSSDB based applications allowed to use smart card

Description

Enable this group policy to load the Tokend PKCS11 module to a location of your choice. The location you specify should be where the profiles.ini file is for the user's profile. For example:

• • • • •

- Firefox default location: ~/Library/Application Support/Firefox
- Thunderbird default location: ~/Library/Thunderbird

This group policy only supports locations under user home. The location path must start with ~.

To remove the importing feature, you must set this group policy to Disabled.

Note that you have to enable smart card support for NSSDB based applications to access a smart card.

Once enabled, this group policy takes effect dynamically at the next group policy refresh interval.

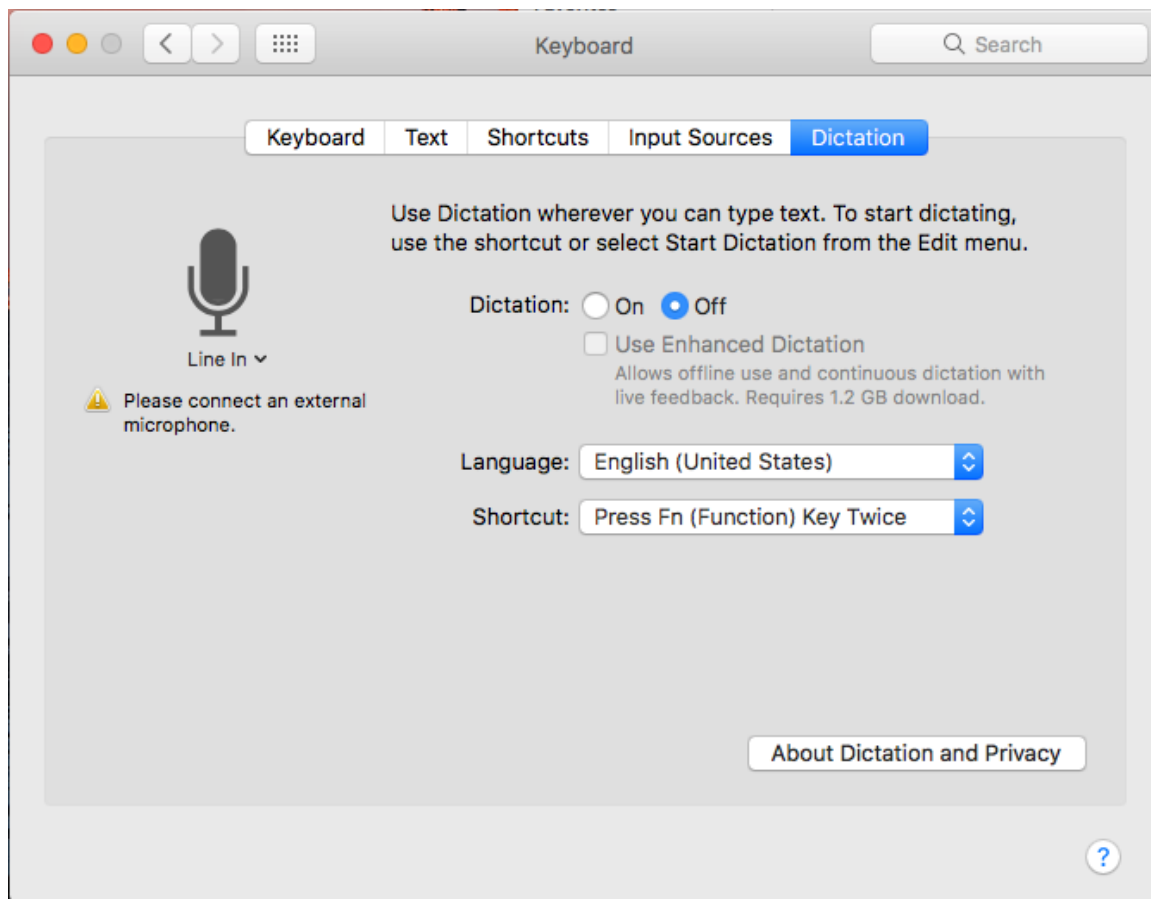

Disable Dictation

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > Disable Dictation

Description

Enable this policy to turn off Dictation in the System Preferences > Keyboard pane.

Once enabled, this group policy takes effect dynamically at the next group policy refresh interval.

Require a password to wake this computer from sleep or screen saver

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > Require a password to wake this computer from sleep or screen saver

Description

Lock the computer screen when the computer goes into sleep or screen saver mode and requires users to enter a user name and password to unlock the screen.

• • • • •

Enabling this group policy is the same as clicking the **Require a password to wake this computer from sleep or screen saver** option in the Security system preference.

After this group policy is enabled, it takes effect when the computer is rebooted.

Prohibit authentication with expired password

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > Prohibit authentication with expired password

Description

Prohibit a user from unlocking the screen if a password change is required while the screen is locked. If a user logs in with a password that must be changed, and the computer goes into sleep or screen saver mode before the user updates the password, the user is locked out. Disabling this policy allows a user to specify the old password to remove the screen lock.

Lock Smart Card screen

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > lock Smart Car screen

Description

Lock the computer screen when the smart card is removed from the reader. You must also enable the **Require a password to wake this computer from**

• • • • •

sleep or screen saver group policy to require a password to unlock the screen.

After this group policy is enabled, it takes effect when the computer is rebooted.

Keychain Policies

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > Keychain Policies

Description

On OS X 10.11, you can create a keychain protected by a smart card token or a password. Once the Enable smart card protected keychain group policy takes effect, the token-protected keychain can only be unlocked with a PIN when the associated smart card is present. This group policy can be configured to allow users who lose or forget their smart card to continue to log in with a password. In this case, a new password-protected keychain is created to ensure users can continue to log in to their account; however, keychain items are not transferred from the token-protected keychain to the password-protected keychain.

This feature is not supported on OS X 10.10 and earlier.

Enable protected keychain

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > Keychain Policies > Enable protected keychain

Description

Create a new keychain protected by either an asymmetric token stored on a smart card or by a password, depending on the log in type. Enabling this policy requires users to have the smart card present to unlock the token-protected keychain.

When the smart card is renewed it will no longer unlock the protected keychain. There is no way to export a token-protected keychain; you will have to recreate the keychain items in the new token-protected keychain. In addition, if a smart card is lost, there is no way to recover items from the token-protected keychain.

The **Set as user default keychain** option is selected by default. This option is required to be able to log in with a password after this group policy takes effect. With this option set, the default keychain will be switched based on the login type (smart card login or password login). Deselect this option to leave the existing login keychain as the default keychain.

The **Delete the Password protected 'Login' Keychain after login** option is deselected by default. Select this option to delete the existing password-protected 'Login' Keychain after logging in with a smart card, leaving no keychains that can be unlocked without a smart card. This option is required to be able to log in with a password after this group policy takes effect without seeing keychain errors.

Note This feature is not supported on OS X 10.10 and earlier.

Lock protected keychain after number of minutes of inactivity

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > Keychain Policies > Lock protected keychain after number of minutes of inactivity

Description

Lock the protected keychain after a period of inactivity that you specify in minutes.

This policy only works if you have enabled the Enable protected keychain group policy.

This policy takes effect at the next user login using smart card authentication.

Lock protected keychain when sleeping

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > Keychain Policies > Lock protected keychain when sleeping

Description

Lock the protected keychain when the machine sleeps.

This policy only works if you have enabled the Enable protected keychain group policy.

This policy takes effect at the next user login using smart card authentication.

Allow all applications to access the auto-enrollment private key(s)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Public Key Policies > Allow all applications to access the auto-enrollment private key(s)

Description

Enabling this policy allows all applications to access the auto-enrollment private key(s) in the System keychain.

See [Configuring auto-enrollment](#) for more information about auto-enrollment keys.

Note This setting only applies to new auto-enrollment private key(s); it will not update already imported auto-enrollment private key(s) that are in the System keychain.

Allow specific applications to access the auto-enrollment private key(s)

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Public Key Policies > Allow specific applications to access the auto-enrollment private key(s)

Description

Enabling this policy allows specified applications to access the auto-enrollment private key(s) in System keychain.

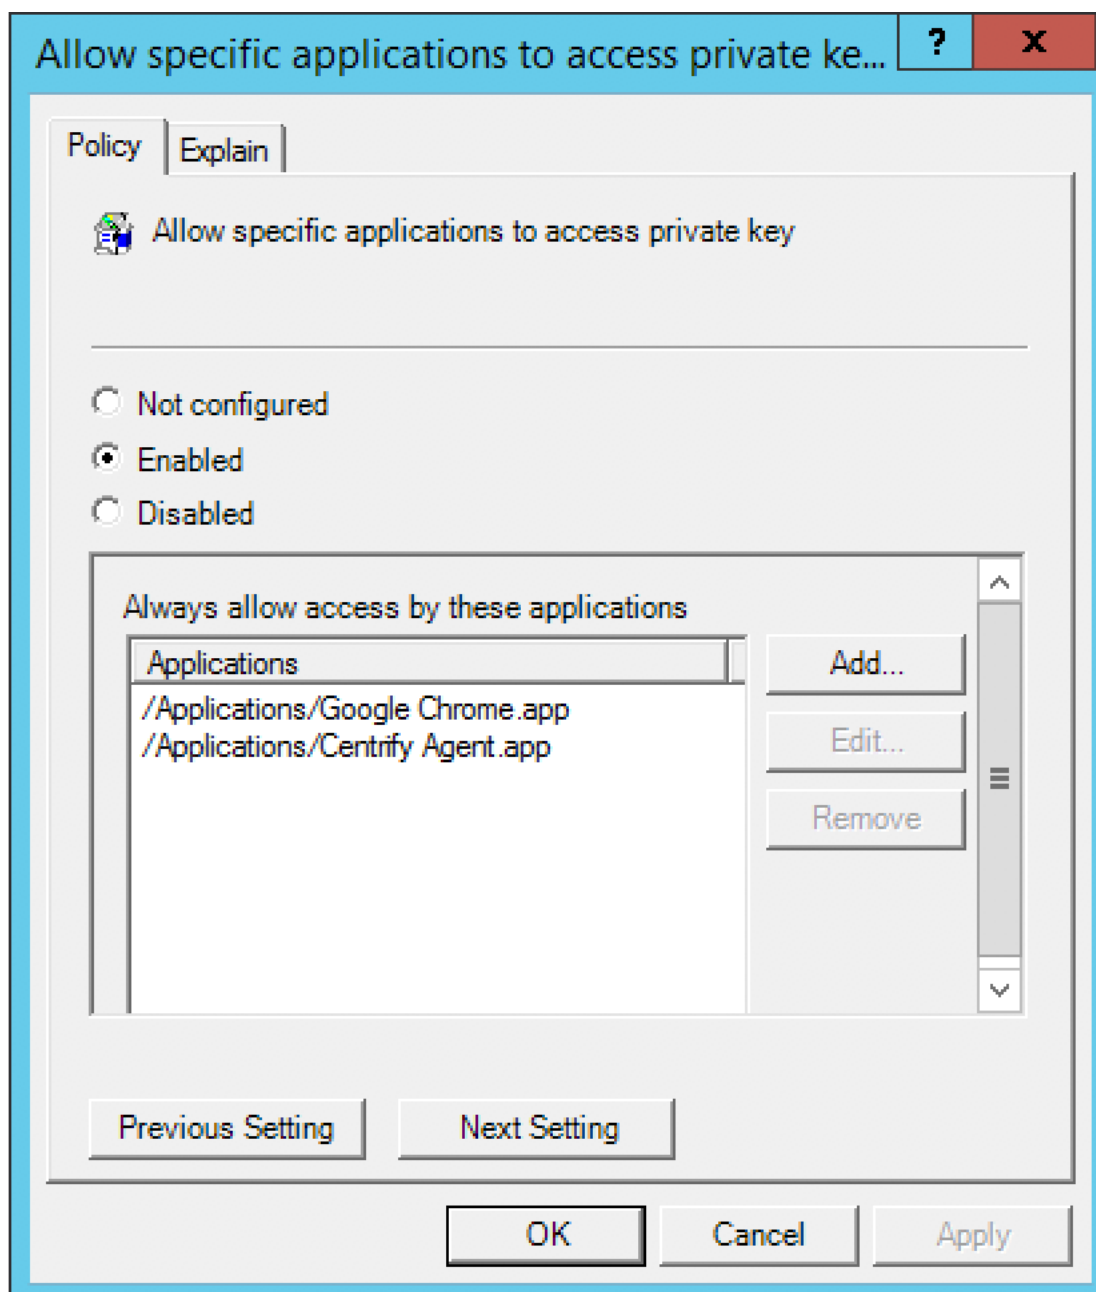

After you enable this policy, click **Add** to enter the path to the application you want to allow access to the auto-enrollment private key, then click **OK**. You can click **Add** again to add additional applications.

For example, to give Google Chrome and Centrify Agent access to the auto-enrollment private key, enter the application path for Google Chrome:

```
/Applications/Google Chrome.app
```

Click **OK**. Then click **Add** and enter the application path for Centrify Agent:

```
/Applications/Centrify Agent.app
```

After this group policy is enabled, the list of applications specified in the group policy are added to the access control list of the auto-enrollment private key in system keychain.

See [Configuring auto-enrollment](#) for more information about auto-enrollment keys.

Note This setting only applies to a new auto-enrollment private key. It does not change auto-enrolled private keys that are already in the keychain.

If the group policy [Allow all applications to access the auto-enrollment private key\(s\)](#) is enabled, this group policy will be ignored.

Do not allow the private key(s) to be extractable

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Public Key Policies > Do not allow private key(s) to be extractable

Description

Enabling this policy prevents exporting the auto-enrollment private key(s).

Note This setting only applies to new auto-enrollment private key(s). It does not change auto-enrolled private keys that are already in the keychain.

System Preference Settings

Path

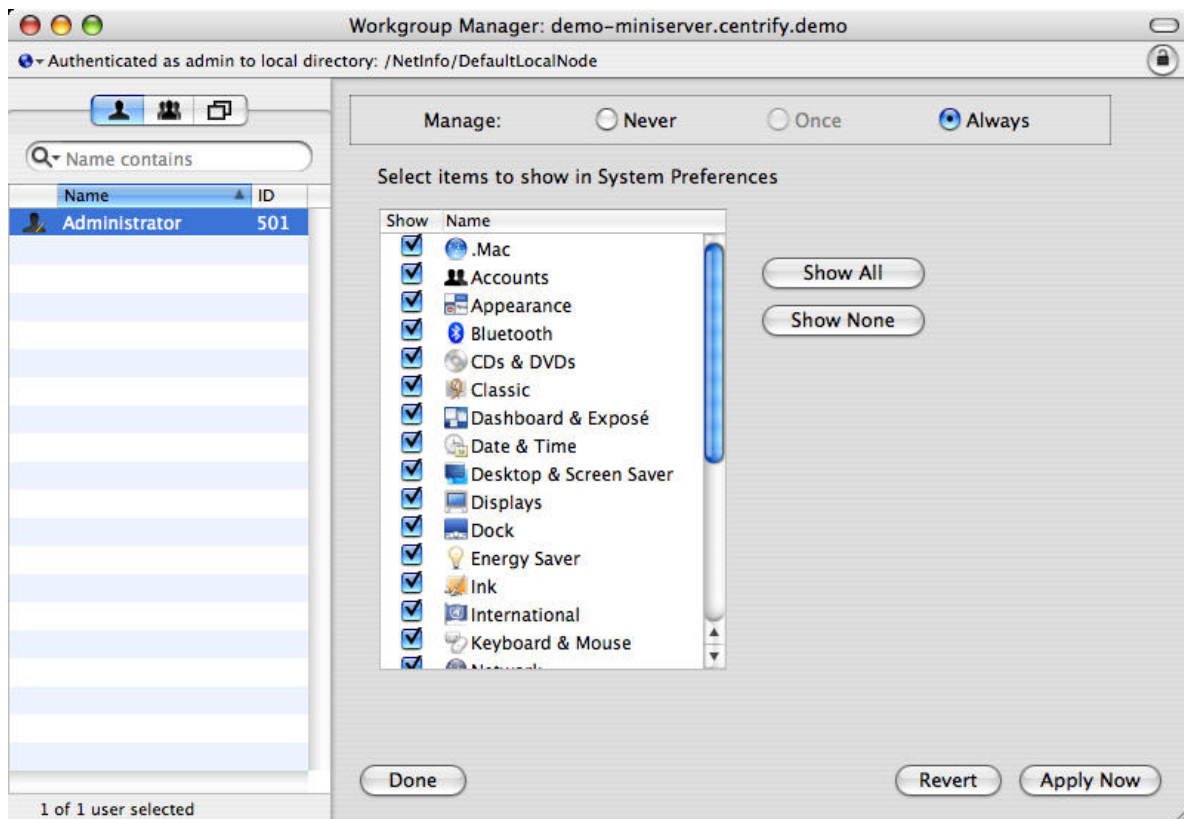

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings

Description

Use the **User Configuration > Policies > Centrify Settings > Mac OS X Settings > System Preference Settings** group policies to specify which preferences are enabled for use in System Preferences for Mac OS X users. Enabling a preference for use does not enable non-admin users to modify that preference. For example, some preferences, such as Startup Disk preferences, require an administrator name and password before a user can modify its settings. Displaying a preference does enable a user to view the preference's current settings.

By default, no system preference panes are displayed unless explicitly enabled. The group policies in this category correspond to System

Preferences you can select for display in the Workgroup Manager. For example:

The user interface for System Preferences Settings differs significantly between different versions of Mac OS X. Therefore, there are separate System Preferences policies for each supported version of Mac OS X. In addition, to support existing installations that configured group policies by using a previous `centrifdc_mac_settings` template, the Centrify group policies provide a set of legacy preferences settings.

The [Use version specific settings](#) group policy determines whether to use legacy settings or platform-specific system preferences settings. By default (if you do not configure or disable this policy) legacy settings are used.

If you enable this policy, you can then enable platform-specific system preferences settings for each platform in your environment; see the following sections for information on each set of policies:

Use version specific settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Use version specific settings

Description

Enable the use of version-specific System Preferences settings.

If you enable this policy, you can then set platform-specific preferences settings for each platform in your environment. For example, if you have only 10.10 computers, you can enable this policy and then use Mac OS X 10.10 settings. If you have 10.9 and 10.10 computers, enable this policy, and then configure the version-specific policies as appropriate:

- Mac OS X 10.9 Settings
- Mac OS X 10.10 Settings

When a computer joins the domain, Centrify Management Services determines the OS version and applies the appropriate Preferences settings.

If this policy is disabled or not configured, Legacy Settings are used instead of version-specific settings. Likewise, Centrify versions prior to 4.4.2 always use Legacy Settings and ignore this policy setting.

If you configured System Preferences settings with a version of the product prior to 4.4.2, these settings are saved to Legacy Settings when you upgrade to the current version. You can keep or edit these settings as you wish.

Note The Legacy Settings may not match exactly the settings for each OS version; for example, some settings may be missing while others may be redundant for a particular OS version.

Legacy Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Legacy Settings

Description

When you upgrade from a version of Centrify prior to 4.4.2, your System Preferences settings are saved to Legacy Settings. You can keep or edit the individual legacy system preferences group policy settings as you wish.

Note The legacy settings may not match exactly the settings for each OS version; for example, some settings may be missing while others may be redundant for a particular OS version.

Showing items in the Personal pane of System Preferences

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Enable System Preferences Pane: Personal

Description

Use the group policies in this category to choose which items to display in the Personal pane of System Preferences.

Enable Appearance

Enable usage of Appearance preferences in the Personal pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Dashboard & Expose

Enable usage of Dashboard & Exposé preferences in the Personal pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Desktop & Screen Saver

Enable usage of Desktop & Screen Saver preferences in the Personal pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Dock

Enable usage of Dock preferences in the Personal pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable International (Language & Text)

Enable usage of International preferences in the Personal pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Security

Enable usage of Security preferences in the Personal pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Spotlight

Enable usage of Spotlight preferences in the Personal pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Showing items in the Hardware System pane of Preferences

Use the group policies in this category to display items in the Hardware pane of System Preferences.

Enable Bluetooth

Enable usage of Bluetooth preferences in the Hardware pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable CDs & DVDs

Enable usage of CDs & DVDs preferences in the Hardware pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Displays

Enable usage of Displays preferences in the Hardware pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Energy Saver

Enable usage of Energy Saver preferences in the Hardware pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Ink

Enable usage of Ink preferences in the Hardware pane of System Preferences.

Note Ink preferences are only shown if a graphics tablet is connected to the Mac computer.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Keyboard & Mouse (Keyboard)

Enable usage of Keyboard & Mouse preferences in the Hardware pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Mouse

Enable usage of Mouse preferences in the Hardware pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Print & FAX

Enable usage of Print & FAX preferences in the Hardware pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Sound

Enable usage of Sound preferences in the Hardware pane of System Preferences.

• • • • •

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Trackpad

Enable usage of Trackpad preferences in the Hardware pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Showing items in the Internet & Network pane of System Preferences

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Enable System Preferences Pane: Internet & Network

Description

Use the group policies in this category to display items in the Internet & Network pane of System Preferences.

Enable .Mac (MobileMe)

Enable usage of .Mac preferences in the Internet & Network pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Fibre Channel

Enable usage of Fibre Channel preferences in the Internet & Network pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Network

Enable usage of Network preferences in the Internet & Network pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable QuickTime

Enable usage of QuickTime preferences in the Internet & Network pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Sharing

Enable usage of Sharing preferences in the Internet & Network pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Showing items in the System pane of System Preferences

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Enable System Preferences Pane: System

Description

Use the group policies in this category to display items in the System pane of System Preferences.

Enable Accounts

Enable usage of Accounts preferences in the System pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Classic

Enable usage of Classic preferences in the System pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Date & Time

Enable usage of Date & Time preferences in the System pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Parental Controls

Enable usage of Parental Controls preferences in the System pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Software Update

Enable usage of Software Update preferences in the System pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Speech

Enable usage of Speech preferences in the System pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Startup Disk

Enable usage of Startup Disk preferences in the System pane of System Preferences.

• • • • •

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Time Machine

Enable usage of Time Machine preferences in the System pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Enable Universal Access

Enable usage of Universal Access preferences in the System pane of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

Showing items in the Other pane of System Preferences

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Enable System Preferences Pane: Other

Description

Use the group policies in this category to display the items you specify in the Other pane of System Preferences.

Other Preferences Panes

Enable usage of additional preferences panes of System Preferences.

Once this group policy is enabled, it takes effect when users log out and log back in.

System Preferences Mac OS X 10.5 Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.5 Settings

Description

If your environment does not contain Mac OS X 10.5 computers, you can ignore the group policies in this folder.

System Preferences Mac OS X 10.6 Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.6 Settings

Description

If your environment does not contain Mac OS X 10.6 computers, you can ignore the group policies in this folder.

System Preferences Mac OS X 10.7 Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.7 Settings

Description

The Mac OS X 10.7 Settings allow you to configure system preferences policies that apply specifically to Mac OS X 10.7 computers. Because the user interface varies between different versions of Mac OS X, separate policies are provided for each version. See [Legacy Settings](#) for older versions of Mac OS X.

If your environment does not contain Mac OS X 10.7 computers, you can ignore these settings.

Limit items usage in System Preferences

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.7 Settings > Limit items usage in System Preferences

Description

Limit the usage of items in the System Preferences panel.

Once enabled, this group policy takes effect when users log out and log back in.

Enable System Preferences Panes 10.7

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.7 Settings > Enable System Preferences Panes

Description

Use [Enable built-in System Preferences panes](#) to select the items to add to the standard System Preferences panes.

Use [Enable other System Preferences panes](#) to add preferences for third-party applications to the Other pane of the System Preferences.

Enable built-in System Preferences panes

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.7 Settings > Enable System Preferences Panes > Enable built-in System Preferences Panes

Description

Select items to add to the System Preferences panel.

This policy is only effective if the [Limit items usage on System Preferences](#) group policy is enabled. If the **Limit items usage in System Preferences** group policy is not configured or is disabled, this group policy is ignored.

Once enabled, this group policy takes effect when users log out and log back in.

Enable other System Preferences panes

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.7 Settings > Enable System Preferences Panes > Enable other System Preferences panes

Description

Define a list of additional items to add to the Other pane of the System Preferences panel.

Preference pane applications are actually collections of files inside a directory (called bundles). Inside the Contents directory of every preference pane application is the `info.plist` file, and inside that file is the `CFBundleIdentifier` key that identifies the preference pane application. You need to use the value for this key when adding a preference pane application.

Generally, installed third party preference panes can be found in `/System/Library/PreferencePanes`, `/Library/PreferencePanes` or `~/Library/PreferencePanes`.

You can find the `CFBundleIdentifier` key by using the `defaults` command. For example, to find the value for the QuickTime pane, use the following command in a terminal window:

```
defaults read
/System/Library/PreferencePanes/QuickTime.prefPane
/Contents/info CFBundleIdentifier
```

which returns:

```
com.apple.preference.quicktime
```

To display the QuickTime icon in the **Other** pane of the System Preferences Panel, enable this policy, then click **Add** and enter `com.apple.preference.quicktime`.

This policy is only effective if the [Limit items usage on System Preferences](#) group policy is enabled. If the **Limit items shown in System Preferences** group policy is not configured or is disabled, this group policy is ignored.

Once enabled, this group policy takes effect when users log out and log back in.

System Preferences Mac OS X 10.8 Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.8 Settings

Description

The Mac OS X 10.8 Settings allow you to configure system preferences policies that apply specifically to Mac OS X 10.8 computers. Because the user interface varies between different versions of Mac OS X, separate policies are provided for each version. See [Legacy Settings](#) for older versions of Mac OS X.

If your environment does not contain Mac OS X 10.8 computers, you can ignore these settings.

Limit items usage in System Preferences

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.8 Settings > Limit items usage in System Preferences

Description

Limit the usage of items in the System Preferences panel.

Once enabled, this group policy takes effect when users log out and log back in.

Enable System Preferences Panes 10.8

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.8 Settings > Enable System Preferences Panes

Description

Use [Enable built-in System Preferences panes](#) to select the items to add to the standard System Preferences panes.

Use [Enable other System Preferences panes](#) to add preferences for third-party applications to the Other pane of the System Preferences.

Enable built-in System Preferences panes

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.8 Settings > Enable System Preferences Panes > Enable built-in System Preferences panes

Description

Select items to add to the System Preferences panel.

This policy is only effective if the [Limit items usage on System Preferences](#) group policy is enabled. If the **Limit items shown in System Preferences** group policy is not configured or is disabled, this group policy is ignored.

Once enabled, this group policy takes effect when users log out and log back in.

Enable other System Preferences panes

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.8 Settings > Enable System Preferences Panes > Enable other System Preferences panes

Description

Define a list of additional items to add to the Other pane of the System Preferences panel.

Preference pane applications are actually collections of files inside a directory (called bundles). Inside the Contents directory of every preference pane application is the `info.plist` file, and inside that file is the `CFBundleIdentifier` key that identifies the preference pane application. You need to use the value for this key when adding a preference pane application.

Generally, installed third party preference panes can be found in `/System/Library/PreferencePanes`, `/Library/PreferencePanes` or `~/Library/PreferencePanes`.

You can find the `CFBundleIdentifier` key by using the `defaults` command. For example, to find the value for the QuickTime pane, use the following command in a terminal window:

```

/System/Library/PreferencePanes/QuickTime.prefPane
/Contents/info CFBundleIdentifier
```

which returns:

```
com.apple.preference.quicktime
```

To display the QuickTime icon in the **Other** pane of the System Preferences Panel, enable this policy, then click **Add** and enter `com.apple.preference.quicktime`.

This policy is only effective if the [Limit items usage on System Preferences](#) group policy is enabled. If the **Limit items shown in System**

• • • • •

Preferences group policy is not configured or is disabled, this group policy is ignored.

Once enabled, this group policy takes effect when users log out and log back in.

System Preferences Mac OS X 10.9 Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.9 Settings

Description

The Mac OS X 10.9 Settings allow you to configure system preferences policies that apply specifically to Mac OS X 10.9 computers. Because the user interface varies between different versions of Mac OS X, separate policies are provided for each version. See [Legacy Settings](#) for older versions of Mac OS X.

If your environment does not contain Mac OS X 10.9 computers, you can ignore these settings.

Limit items usage in System Preferences

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.9 Settings > Limit items usage in System Preferences

Description

Limit the usage of items in the System Preferences panel.

• • • • •

Once enabled, this group policy takes effect when users log out and log back in.

Enable built-in System Preferences panes

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.9 Settings > Enable System Preferences Panes > Enable built-in System Preferences panes

Description

Select items to add to the System Preferences panel.

This policy is only effective if the [Limit items usage on System Preferences](#) group policy is enabled. If the **Limit items shown in System Preferences** group policy is not configured or is disabled, this group policy is ignored.

Once enabled, this group policy takes effect when users log out and log back in.

Enable other System Preferences panes

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.9 Settings > Enable System Preferences Panes > Enable other System Preferences panes

Description

Define a list of additional items to add to the Other pane of the System Preferences panel.

.....

Preference pane applications are actually collections of files inside a directory (called bundles). Inside the contents directory of every preference pane application is the `info.plist` file, and inside that file is the `CFBundleIdentifier` key that identifies the preference pane application. You need to use the value for this key when adding a preference pane application.

Generally, installed third party preference panes can be found in `/System/Library/PreferencePanes`, `/Library/PreferencePanes` or `~/Library/PreferencePanes`.

You can find the `CFBundleIdentifier` key by using the `defaults` command. For example, to find the value for the QuickTime pane, use the following command in a terminal window:

```
defaults read  
/System/Library/PreferencePanes/QuickTime.prefPane  
/Contents/info CFBundleIdentifier
```

which returns:

```
com.apple.preference.quicktime
```

To display the QuickTime icon in the **Other** pane of the System Preferences Panel, enable this policy, then click **Add** and enter `com.apple.preference.quicktime`.

This policy is only effective if the [Limit items usage on System Preferences](#) group policy is enabled. If the **Limit items shown in System Preferences** group policy is not configured or is disabled, this group policy is ignored.

Once enabled, this group policy takes effect when users log out and log back in.

System Preferences Mac OS X 10.10 or above Settings

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.10 Settings

Description

The Mac OS X 10.10 or above Settings allow you to configure system preferences policies that apply specifically to Mac OS X 10.10 and above computers. Because the user interface varies between different versions of Mac OS X, separate policies are provided for each version. See [Legacy Settings](#) for other versions of Mac OS X.

If your environment does not contain Mac OS X 10.10 or above computers, you can ignore these settings.

Limit items usage on System Preferences

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.10 Settings > Limit items usage on System Preferences

Description

Limit the usage of items in the System Preferences panel.

Once enabled, this group policy takes effect when users log out and log back in.

Enable System Preferences Panes 10.10

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.10 Settings > Enable System Preferences Panes

Description

Use [Enable other System Preferences panes](#) to add preferences for third-party applications to the Other pane of the System Preferences.

Enable built-in System Preferences panes

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.10 Settings > Enable System Preferences Panes > Enable built-in System Preferences panes

Description

Enable this group policy to enable the built-in System Preferences panes.

Enable or disable usage of items in the built-in System Preferences panes by checking or unchecking boxes corresponding to the items.

This policy is only effective if the [Limit items usage on System Preferences](#) group policy is enabled. If the **Limit items shown in System Preferences** group policy is not configured or is disabled, this group policy is ignored.

Once enabled, this group policy takes effect when users log out and log back in.

Enable other System Preferences panes

Path

User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy Settings > System Preference Settings > Mac OS X 10.10 Settings > Enable System Preferences Panes > Enable other System Preferences panes

Description

Define a list of additional items to add to the Other pane of the System Preferences panel.

Preference pane applications are actually collections of files inside a directory (called bundles). Inside the Contents directory of every preference pane application is the `info.plist` file, and inside that file is the `CFBundleIdentifier` key that identifies the preference pane application. You need to use the value for this key when adding a preference pane application.

Generally, installed third party preference panes can be found in `/System/Library/PreferencePanes`, `/Library/PreferencePanes` or `~/Library/PreferencePanes`.

You can find the `CFBundleIdentifier` key by using the `defaults` command. For example, to find the value for the QuickTime pane, use the following command in a terminal window:

```
defaults read
/System/Library/PreferencePanes/QuickTime.prefPane
/Contents/info CFBundleIdentifier
```

which returns:

```
com.apple.preference.quicktime
```

To display the QuickTime icon in the **Other** pane of the System Preferences Panel, enable this policy, then click **Add** and enter `com.apple.preference.quicktime`.

This policy is only effective if the [Limit items usage on System Preferences](#) group policy is enabled. If the **Limit items shown in System Preferences** group policy is not configured or is disabled, this group policy is ignored.

Once enabled, this group policy takes effect when users log out and log back in.

Configuring a Mac computer for smart card login

This chapter explains how to set up smart card login for a Mac computer.

The following topics are covered:

- Understanding smart card login
- Supported smart card profiles
- Configuring smart card login
- Using smart card login
- Troubleshooting smart card log in
- Configuring web browsers and mail clients

Understanding smart card login

Smart cards provide an enhanced level of security authentication for logging into an Active Directory domain. To configure a smart card for use on a Mac computer that is running the Centrify agent, requires that you have already set up a smart card for use in a Windows domain. You do not need to add any smart card infrastructure to the Mac computer, other than a smart card reader and a provisioned smart card.

In a Windows environment, a smart card may be set up either for a single user account or for multiple user accounts. For example, an individual contributor might have access to a single Active Directory account that he uses for all his work. In this case, the card is set up for a single user and the card is linked directly to a UPN. When a user inserts the card to log on, the smart card system looks for the UPN in Active Directory and prompts for a PIN.

Windows 2008 also provides a name-mapping feature that enables configuring a smart card with multiple user accounts. For example, a user might want to log in with a regular account to check mail or perform routine tasks, but log in with an administrator's account to perform privileged tasks. To set up a card for multiple users, an administrator maps a certificate to each user account on the card. When a user inserts the card to log on, the smart card system prompts the user to select which account to use, and prompts for the card's PIN.

If you have set up smart card login for Windows clients in a domain, you can use Access Manager to configure smart card login for Mac clients joined to the same domain. If you have provisioned a smart card for use on a Windows computer — either for a single user or multiple users — once you configure smart card support for a Mac computer, you can use the same smart card to log in to a Mac computer.

Note Configuring smart card support in Access Manager is nearly the same for a single-user or multi-user card with the exception that for multi-user cards, you must set an extra configuration parameter as explained in [Enabling support for multi-user PIV and multi-user smart cards](#).

Setting up a single user smart card login for Windows requires either:

- Microsoft enterprise root certification authority; see the Microsoft TechNet article: [Install an enterprise root certification authority](#).
- A third party certification authority — see the Microsoft KB article: [Guidelines for enabling smart card logon with third-party certification authorities](#).

Setting up a multi-user smart card login for Windows requires mapping the certificate on the card to the users who the card is associated with. See the following Microsoft Technet Blog post: "[Mapping One Smart Card to Multiple Accounts](#)" for more information on how to do this.

For more information about how Access Manager supports smart card log in, see the following video chalk talks:

[Smart Card for Mac Part 1: Introduction to Active Directory Integration](#), which provides a basic introduction to smart card for Access Manager.

[Smart Card for Mac Part 2: Architecture & Authentication Flow](#), which provides technical details about the Access Manager implementation of smart card.

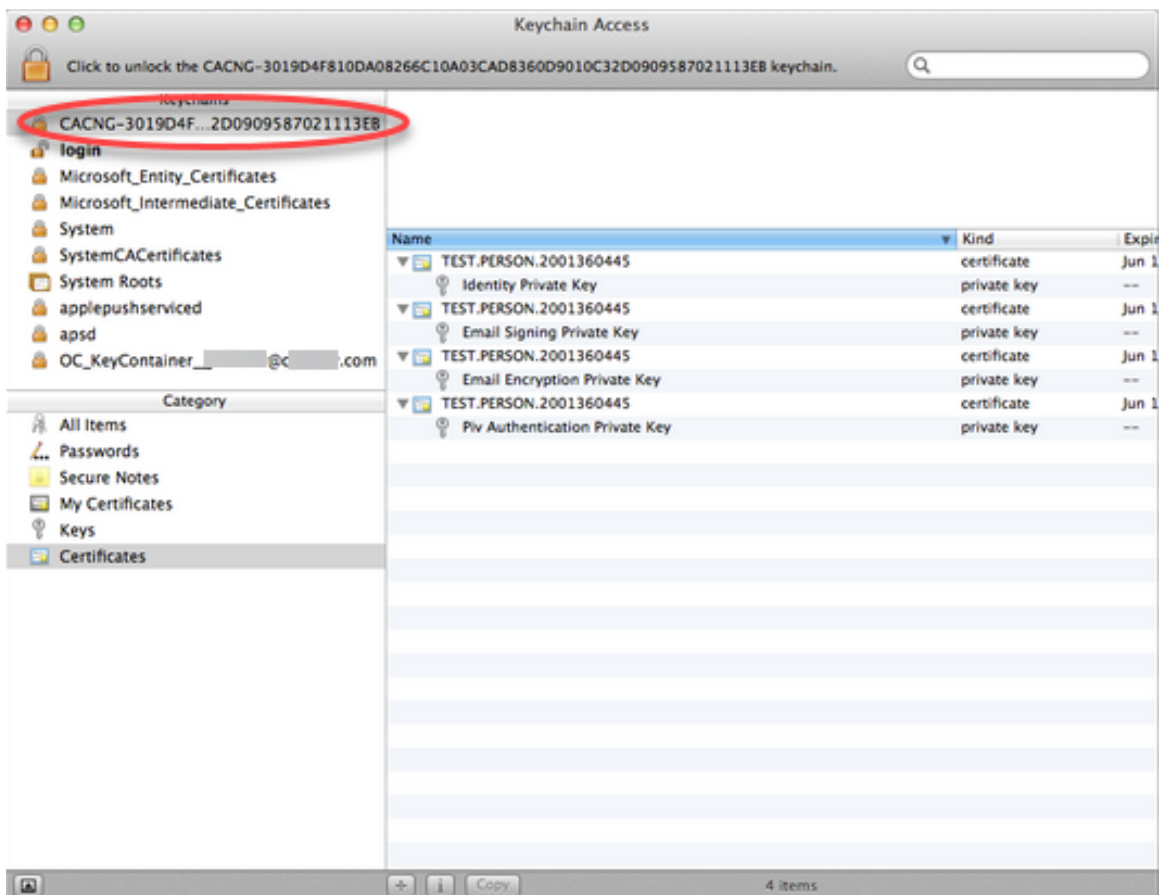

Supported smart card profiles

Centrify supports the following smart card profiles to log in to Active Directory on Macs in the same fashion as Windows systems, ensuring strong authentication and single sign-on to other applications and services for Active Directory users.

- CAC
- CAC NG
- PIV
- PIV-I
- USB PKI Keys

To verify the profile used by your smart card

Insert the smart card into the reader and the keychain for the smart card certificate appears in the **Keychains** window, whose name is in the form, *CardProfile-CardNumber*. For example:

If the new keychain does not appear, quit and restart Keychain Access.

Configuring smart card login

Centrify provides group policies, configuration options, and account options to perform the following smart card configuration tasks.

Note Before configuring smart card login, refer to [Verifying prerequisites for configuring smart card login](#) to ensure your environment meets all the prerequisites.

- [Enabling smart card support \(including authentication via YubiKey tokens\)](#)
- [Enabling support for multi-user PIV and multi-user smart cards](#)
- [Enabling smart card support for sudo](#)
- [Enabling protected keychains](#)
- [Requiring smart card login](#)
- [Enabling certificates that do not have the extended key usage \(EKU\) attribute](#)
- [Verifying smart card configuration](#)
- [Enabling screen locking for smart card removal](#)
- [Disabling smart card support](#)

Verifying prerequisites for configuring smart card login

We recommend configuring your Active Directory domain and forest to use AES-128 or AES-256 encryption for Kerberos in order to ensure you can configure smart card login. DES and RC4 encryption are no longer supported. Other prerequisites for enabling smart card support differ depending on whether you have configured a single-user or multi-user smart card.

For a single-user card, before enabling smart card support, make sure you do the following:

- Provision a smart card with an NT principal name and PIN.
Refer to [Supported smart card profiles](#) to verify that the profile on your smart card is supported by Centrify.
- Verify that the Active Directory Zone user's UPN matches the UPN on the smart card.

For a multi-user card, before enabling smart card support, make sure you have the following in place:

- A Windows Server 2008 or above domain controller for authentication.
- The card is not configured with a UPN. If a card with a UPN is inserted, the Mac prompts for a PIN rather than prompting for a username and password.
- An administrator has added the certificate on the card to the name mapping for the users the card is associated to. See the following Microsoft Technet Blog post: "[Mapping One Smart Card to Multiple Accounts](#)" for more information on how to do this.

For either type of card, verify that the public key infrastructure to support smart card login is operational on the Windows computer running Active Directory and Access Manager. If the user is able to log in to a Windows computer with a smart card, and you have a card reader and a fully-provisioned card for the Mac computer, the user should be able to log in to the Mac computer once you configure it for smart card support.

Enabling smart card support (including authentication via YubiKey tokens)

Smart card and YubiKey token support requires configuration changes to Mac OS X. Enabling the relevant policies makes the required changes to Mac configuration files.

To enable smart card support for logging on

1. Make a backup of the authorization database by exporting it to a plist file on all computers for which you are enabling smart card login support. Enabling the group policy **Enable smart card support** causes edits to this file, so you should create a backup to be safe.

```
security authorizationdb read system.login.console >
system.login.console.backup.plist

security authorizationdb read authenticate >
authenticate.backup.plist
```

2. Create or edit an existing Group Policy Object linked to a site, domain, or OU that includes Mac computers.
3. In the Group Policy Management Editor, expand **Computer Configuration > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security**, then double-click **Enable smart card support**.
4. Select **Enabled** to enable smart card support.

This group policy adds smart card support to the authorization database on Mac computers that are linked to the group policy object. This policy also creates a text file named `/etc/cacloginconfig.plist` on each computer.

This configuration file directs the Mac smart card log-in to look for a user in Active Directory with a user principal name (UPN) that is the same as the NT Principal Name attribute in the smart card log-in certificate.

Note The `/etc/cacloginconfig` configuration file for use with Access Manager and Active Directory is different from the default configuration file provided by Apple.

5. Select **Enable YubiKeys as a smart card** to enable authentication using a YubiKey PIV token.

Enabling YubiKeys as a smart card installs Yubico's libccid to enable communication to the YubiKey using CCID protocol. To authenticate with a YubiKey PIV token, the certificates issued to the YubiKey must be part of a domain that is already provisioned and setup to accept PIV smart cards. See <https://support.yubico.com/support/solutions> for more information about YubiKeys.

After reboot, the computers linked to the group policy object are ready for smart card use. Complete the procedure in the next section if you plan to use multi-user smart cards with your Mac computers, or go to [Enabling screen locking for smart card removal](#) to enable screen locking when the smart card is removed from a computer.

Enabling support for multi-user PIV and multi-user smart cards

- If you plan to use multi-user PIV cards or multi-user smart cards with a Mac computer in your domain, you must make the following changes in your environment.
- [Configure Active Directory to support multi-user PIV cards and multi-user smart cards](#)
- [Configure Centrify to support multi-user PIV cards and multi-user smart cards](#)

Note Making the following changes results in an environment that supports multi-user PIV card login, which means users always need to provide a unixname or UPN. Single-user PIV cards will continue to work; however, those users will be required to provide a username. Military CACNG cards will no longer work if you change your environment to support multi-user PIV cards.

Configure Active Directory to support multi-user PIV cards and multi-user smart cards

The following steps are necessary to support multi-user PIV cards and multi-user smart cards in Active Directory.

- On the computer acting as the Key Distribution Center (KDC), set the following registry key to 0 to disable UPN mapping:

`HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Kdc\useSubjectAltName`
- Export the user smart card certificate and enable name mapping to the users associated with the card. Refer to the following Microsoft Technet Blog post: "[Mapping One Smart Card to Multiple Accounts](#)" for more information.

Configure Centrify to support multi-user PIV cards and multi-user smart cards

- From the Group Policy Management Editor, enable the Disable smart card UPN mapping policy to prevent the login UI from greeting the UPN user identified on the PIV card. This policy is found at **Computer Configuration > Policies > User Configuration > Policies > Centrify**

Settings > Mac OS X Settings > Security & Privacy. Refer to [Security & Privacy](#) for additional information.

Tip Alternatively, you can use the `sctool` command-line tool to disable smart card UPN mapping on an individual Mac for testing or evaluation purposes.

- To disable smart card UPN mapping with `sctool`: `sctool -u '###'`
- To enable smart card UPN mapping with `sctool`: `sctool -u 'NT Principal Name'`
- On the Mac computer where you want to enable support for multi-user PIV cards, set the `smartcard.name.mapping` parameter in the `/etc/centrifydc/centrifydc.conf` file to `true`.

Enabling smart card support for sudo

This group policy configures `sudo` to require the smart card PIN for authentication instead of the user's password. The user must be configured in the `sudoers` file and a smart card corresponding to the user must be presented at the time `sudo` is run.

If the smart card keychain is unlocked when `sudo` is run, `sudo` will not prompt for the PIN for authentication.

To enable smart card authorization for sudo

1. Make a backup of the following files.
 - `/etc/pam.d/sudo`
 - `/etc/pam.d/sudo.pre_cdc`
2. Create or edit an existing Group Policy Object linked to a site, domain, or OU that includes Mac OS X computers.
3. In the Group Policy Management Editor, expand **Computer Configuration > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy**, then double-click **Enable smart card support for sudo**.
4. Select the **Enabled** option and click **OK**.

Enabling protected keychains

On OS X 10.11, you can enable the **Enable protected keychain** group policy to create a keychain protected by either a smart card token or a password and set it as the default keychain, depending on the log in type. Once the Enable protected keychain group policy takes effect, the token-protected keychain can only be unlocked with a PIN when the associated smart card is present.

In addition, you can select options in the group policy that allow users who forget or lose their smart card to continue to log in with a password. In this case, a new password-protected keychain is created to ensure users can continue to log in to their account; however, keychain items are not transferred from the token-protected keychain to the password-protected keychain.

This feature is not supported on OS X 10.10 and earlier.

Note When the smart card is renewed it will no longer unlock the token-protected keychain. There is no way to export a token-protected keychain; you will have to recreate the keychain items in the new token-protected keychain. In addition, if a smart card is lost, there is no way to recover items from the token-protected keychain.

To create a smart card token protected keychain

1. Enable the **Enable protected keychain** group policy (**User Configuration > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Keychain Policies > Enable protected keychain**).
2. Select the **Set as user default keychain** option to make the protected keychain the default keychain.
The group policy switches the default keychain depending on login type (smart card login or password login). This option is selected by default, and is required to be able to log in with a password after this group policy takes effect.
3. Select the **Delete the Password protected 'Login' Keychain after login** option to delete the existing password protected 'Login' keychain.

This removes existing keychains that can be unlocked without a smart card. This option is deselected by default, but is required to be able to log in with a password after this group policy takes effect without seeing keychain errors.

4. Click **Apply**, then click **OK**.

Once enabled, this policy takes effect at the next user login using smart card authentication. Connect only one smart card to the client machine to log in and create a token-protected keychain. Choosing a specific smart card to protect the keychain when multiple smart cards are present is not supported.

5. (Optional) Set parameters for when to lock the protected keychain using the following two group policies.

- Lock protected keychain after number of minutes of inactivity
- Lock protected keychain when sleeping

Note If you do not enable these policies, the default behavior for a new keychain is to lock after five minutes or when sleeping.

Both of these policies take effect at the next user login using smart card authentication.

Requiring smart card login

To fully support smart card login, you can do either one of the following.

- Configure a computer to require smart card login by enabling the [Require smart card login](#) group policy (**Computer Configuration > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Require smart card login**.) When you enable this policy, no one can log into a computer for which this policy applies with a user name and password but must insert a smart card, unless you create an exception group. An exception group is simply an Active Directory group that you create and add to this group policy to allow group members to log in, if necessary, with a user name and password. The purpose of creating an exception group is to allow users to temporarily log in if they do not have their smart card in hand.

Note If you use set this policy, be certain that all users have their passwords set to never expire. Otherwise, if a password expires, a

Note user may be unable to log in with a smart card and see a potentially confusing error message about changing their password. If you use the option to require smart card login for specific users, as explained in the next bullet, you can ignore password expiration.

- Set an individual user's account options to require login with a smart card, as shown in the following procedure. When you set this option, the user cannot interactively log in to a computer with a user name and password but must insert a smart card. Do not use this option if you want to allow specific users to log in temporarily with a user name and password in case they do not have their smart card with them. In this case, use the Require smart card login group policy and create and add an exception group.

To require smart-card login for a specific user:

1. Open the Access Manager console or Active Directory Users and Computers.
2. Select the user. For example, in the Access Manager console, open **domainName > Zones > zoneName > Users > userName**.
3. Right-click the **userName** and select **Properties**.
4. Select the **Account** tab.
5. In Account options, scroll until **Smart card is required for interactive logon** is visible, then select it.
6. Click **OK**.

Enabling certificates that do not have the extended key usage (EKU) attribute

Normally, smart card use requires certificates that contain the extended key usage attribute. However, Windows provides a group policy that allows the use of certificates that do not have this attribute.

Note This group policy is implemented as an administrative template (.adm file), not as an xml file, as are the Centrify group policies.

To enable certificates that do not have the EKU attribute for use with smart cards:

1. Open the group policy editor and edit the GPO that contains the Linux computers enabled for smart-card login.
2. Open **Computer Configuration > Policies > Administrative Templates > Windows Components > Smart Card** and double-click **Allow certificates with no extended key usage certificate attribute**.
3. Click **Enabled** and click **OK**.

When you enable this policy, it sets the `smartcard.allow.noeku` parameter to true in the Centrify configuration file. Certificates with the following attributes can also be used to log on with a smart card:

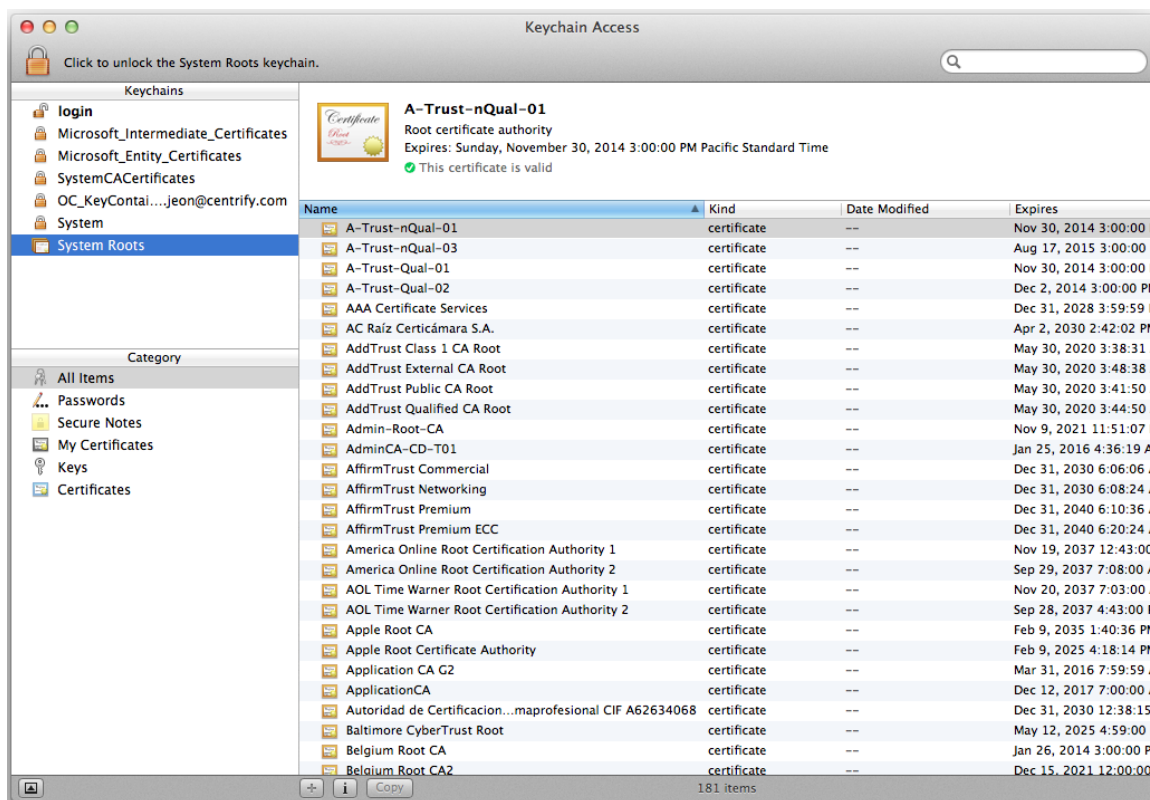

- Certificates with no EKU
 - Certificates with an All Purpose EKU
 - Certificates with a Client Authentication EKU
4. In a Terminal window, run the `sctool` command as root with the `-E (--no-eku)` parameter to re-enable smart card support. You must use either the `-a (--altpkinit)` or `-k (--pkinit)` parameter with the `-E` option; for example:

```
sctool -E -k jsmart@acme.com
```

Verifying smart card configuration

After enabling smart card support, as described in [Configuring smart card login](#), do the following to verify that a smart card is working:

1. Verify that the user is enabled for the zone the Mac computer has joined.
On the Windows computer, open Activity Directory Users and Computers or the Access Manager console and view the Centrify Profile for the user. Verify that the user has a profile and is assigned to a role in the zone to which the Mac computer is joined.
2. On the Mac computer, Click **Utilities > Keychain Access**.

3. Insert the smart card into the reader and the keychain for the smart card certificate appears in the **Keychains** window, whose name is in the form, *CardProfile-CardNumber*, for example, CAC-4190-6145-7ACC-2122.

If the new keychain does not appear, quit and restart Keychain Access.

4. Double-click the certificate for the user in the right-hand pane, for example, **test user 3**.
5. Scroll to find the NT Principal name; for example:

NT Principal Name tuser3@myDomain.com

The NT Principal name in the certificate should match the UPN in Active Directory.

Enabling screen locking for smart card removal

Depending on what you consider best practices for using a smart card, you may want the screen to lock when a user removes the smart card. Enabling the **Lock smart card screen** policy creates a daemon that locks the screen if the user removes the smart card.

To enable screen locking when the smart card is removed from a computer:

1. Edit the Group Policy Object (GPO) linked to a site, domain, or OU that includes Mac computers, expand **User Configuration > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security Settings**, then double-click **Lock Smart Card screen**.
2. Select the **Enabled** option and click **OK**.
3. Expand **User Configuration > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security Settings**, then double-click **Require a password to wake this computer from sleep or screen saver** to require a password to unlock the screen.
4. Select the **Enabled** option and click **OK**.

This group policy creates a daemon that listens for the smart card removal event and locks the screen when it occurs.

Disabling smart card support

To disable smart card support:

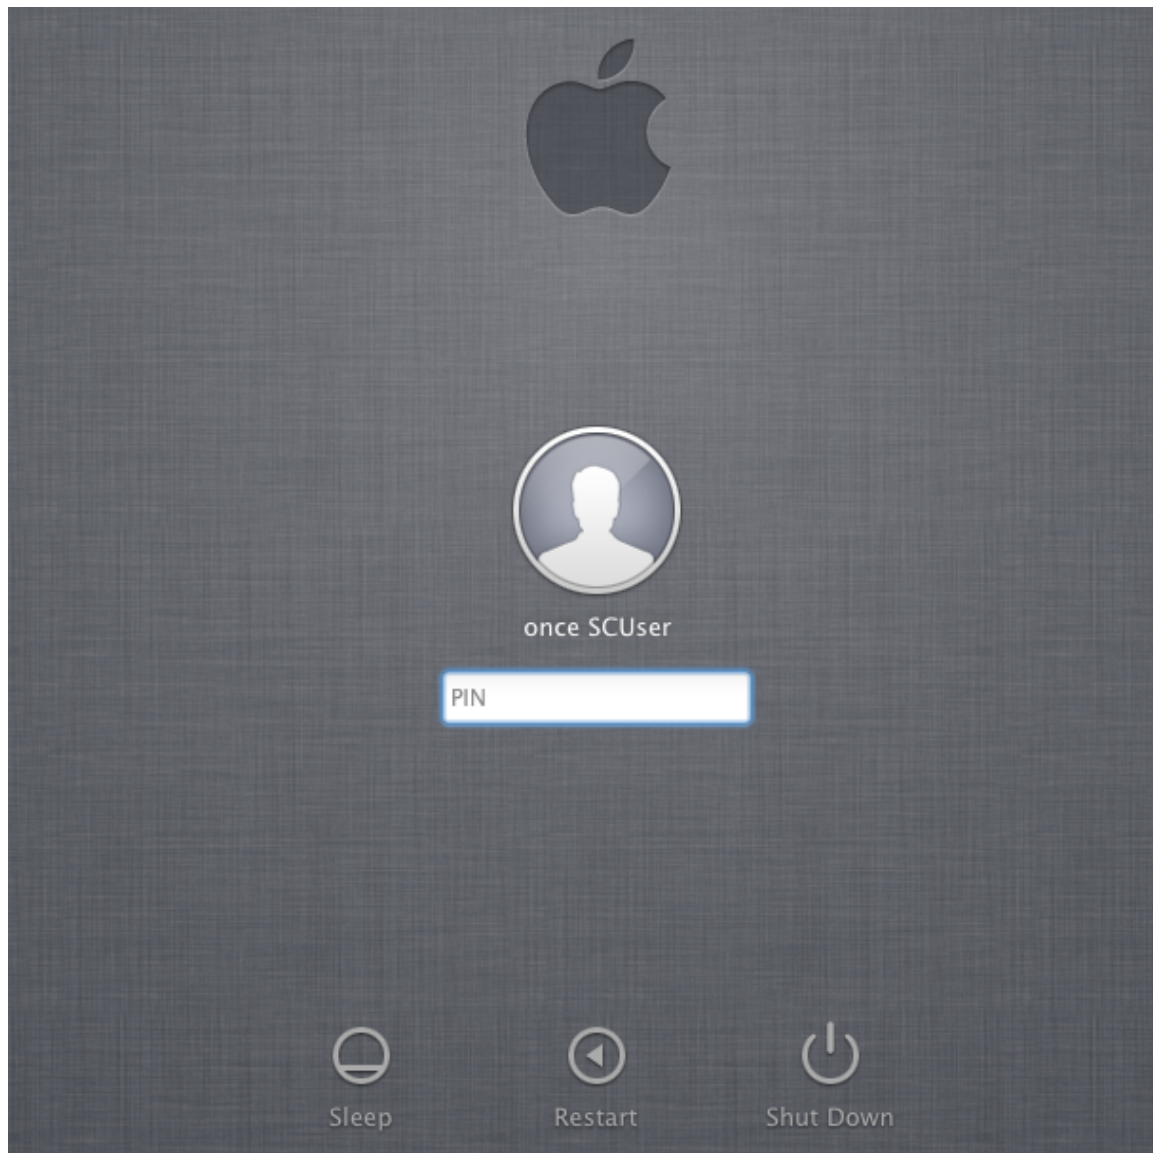

1. Edit the Group Policy Object linked to a site, domain, or OU that includes Mac computers, expand **Computer Configuration > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security**, then double-click **Enable smart card support**.
2. Select **Disabled** and click **OK**.
When the policy takes effect, the smart card specific strings are removed from the authorization database, and the `/etc/cacloginconfig.plist` file is deleted.
3. Expand **User Configuration > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security Settings**, then double-click **Lock Smart Card screen**.
4. Select **Disabled** and click **OK**.

Using smart card login

When a user inserts a smart card into the card reader attached to a Mac computer that is waiting for login, the login dialog is replaced by a smart card enabled login (if the card is provisioned for one or more Active Directory users who are enabled for the Centrify zone to which the computer is joined). However, the actual log on screen varies depending on whether the card is provisioned for a single user or for multiple users.

How the login screen appears for a single-user card

When a user inserts a single-user card, the smart card login shows the name of the user for whom the card is provisioned, and provides a single text box in which the user can type the PIN associated with the card.

If the user is not enabled for the zone, or is not a valid Active Directory user at all, the smart card login dialog is replaced by the previous login screen, either a list of local users or username and password text entry fields.

The user will be successfully logged in if the following conditions are met:

- The user enters the correct PIN for the smart card.
- The card is trusted by the domain and has not been revoked. The card is checked locally first, online or offline, to ensure that the issuing certificate authority is trusted by the Mac computer via keychain trusts, which are set up when the computer joins the domain, and which are periodically refreshed

Checking is performed by the domain controller when online, and by the keychain service based on cached CRLs when offline. If the user is not

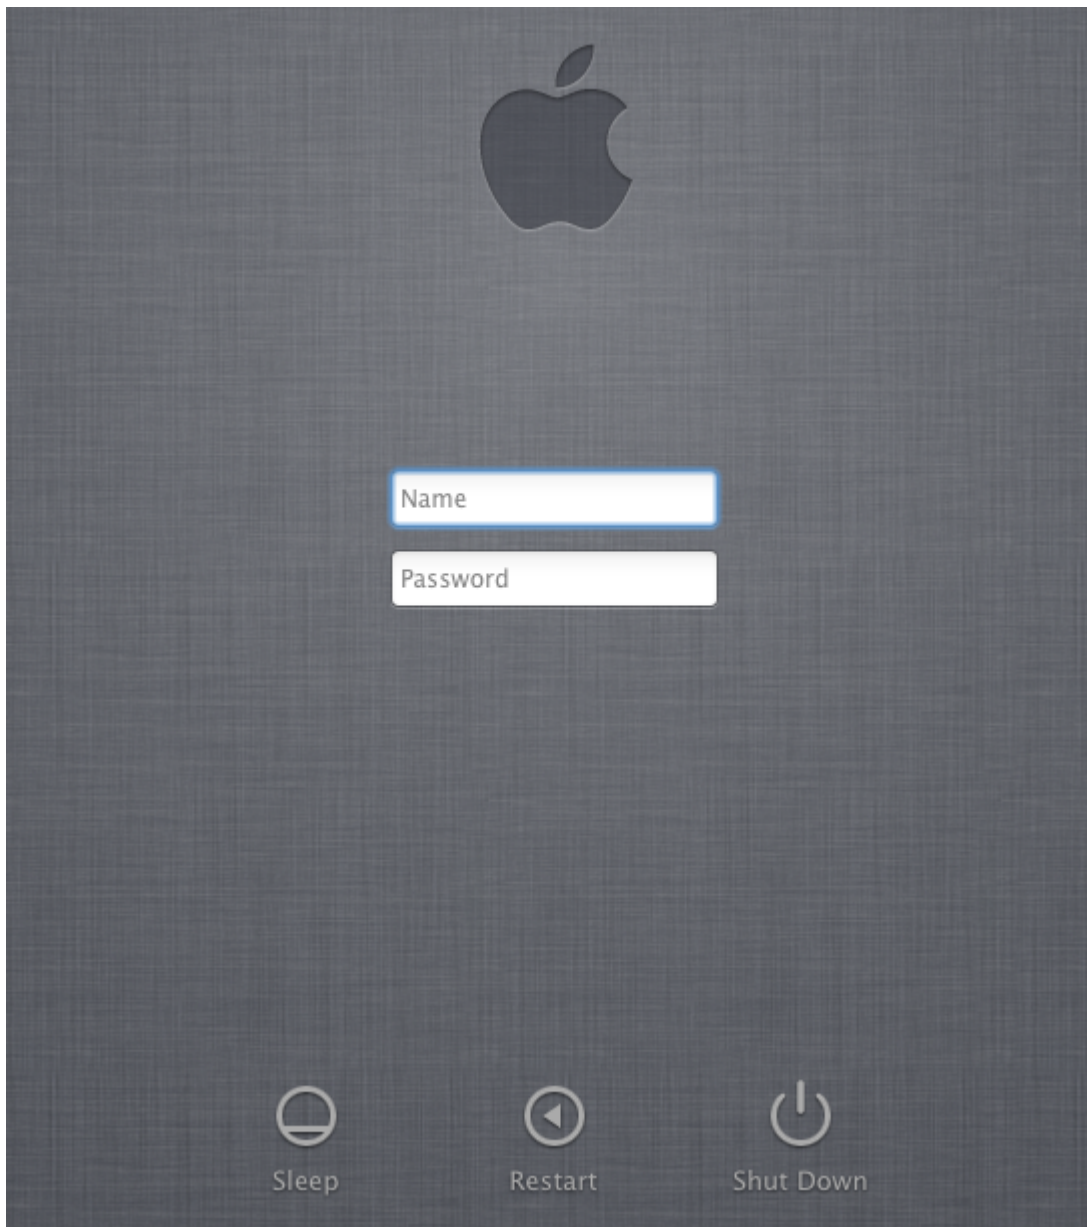

• • • • •

connected to the network but has previously logged on — with a smart card or in some other way — Mac OS X gets the UPN from the card and looks up the user in the cached data.

If login fails, no feedback is provided to the user as to why the login is being denied — as is the case when logging in with a password. Information is logged into system log files that can help determine the reason for a denied login, including: `/var/log/system.log`, `/var/log/secure.log`, and the Centrify log file (`/var/log/centrifydc.log`) if logging is enabled.

How the login screen appears for a multi-user card

When a user inserts a multi-user card, the smart card login shows a generic username and password login screen. The user may select one of the accounts provisioned for the card by typing the account name in the **Name** box. In the **Password** box, the user must enter the PIN for the card, *not* the password for the account.

If the user is not enabled for the zone, or is not a valid Active Directory user at all, the smart card login dialog is replaced by the previous login screen, either a list of local users or username and password text entry fields.

The user will be successfully logged in if the following conditions are met:

- The user enters the correct PIN for the smart card.
- The card is trusted by the domain and has not been revoked. The card is checked locally first, online or offline, to ensure that the issuing certificate authority is trusted by the Mac computer via keychain trusts, which are set up when the computer joins the domain, and which are periodically refreshed

Checking is performed by the domain controller when online, and by the keychain service based on cached CRLs when offline. If the user is not connected to the network but has previously logged on — with a smart card or in some other way — Mac OS X gets the name from the log on screen and looks up the user in the cached data.

If login fails, no feedback is provided to the user as to why the login is being denied — as is the case when logging in with a password. Information is logged into system log files that can help determine the reason for a denied login, including `/var/log/system.log`, `/var/log/secure.log`, and the Centrify log file (`/var/log/centrifydc.log`) if logging is enabled.

Screen saver shows password not PIN prompt

Most smart card users are allowed to log on with a smart card and PIN only — they cannot authenticate with a user name and password. However, it is possible to configure users for both smart card/PIN and user name/password authentication. Generally, this set up works seamlessly: the user either enters a user name and password at the log on prompt, or inserts a smart card and enters a PIN at the prompt.

However, for multi-user cards, it can be problematic when the screen locks and the card is in the reader. When a user attempts to unlock the screen, the system prompts for a password, not for a PIN, although the PIN is required because the card is in the reader. If the user is not aware that the card is still in the reader and enters his password multiple times, the card will lock once the limit for incorrect entries is reached.

Understanding what happens after login

A user who is logged in with a smart card has access to the same Mac and Access Manager features and behaviors as a user who is logged in with a username and password. For example, the user's network home directory is mounted (if so configured), a mobile user is created (if enabled in Group Policy), and so on.

Note In general the user experience is the same in both connected and disconnected modes, with the exception of single sign-on (SSO). Because Access Manager does not cache the smart card's PIN, SSO is only available for smart card login while connected to the domain.

Of course, certain behaviors and system responses are specific to smart card login:

- If the user removes the smart card after login, the response of the system depends on whether the group policy **Lock smart card screen** is enabled in the domain. If it is enabled (and the System Preference to require a password after the screen saver begins is *not* set), the screen locks. Otherwise, the screen does not lock and the user may continue working.
- If the user inserts a smart card while the screen saver is active, the response depends on whether **Lock smart card screen** is enabled in the domain. If it is, the screen saver deactivates. If the policy is not enabled, the screen saver continues running until the user moves the mouse or touches a key.
- When the screen saver deactivates, the system response depends on the following:
 - If **Require password to wake this computer from sleep or screen saver** (and the local version of this policy, if it is not overridden by group policy) is set, the user is prompted to authenticate when the screen saver is deactivated.
 - Otherwise, if **Lock smart card screen** is set, and the screen saver was activated by the user removing the smart card, the user is prompted to authenticate.
 - If neither of these policies is set, the user is not prompted to authenticate when the screen saver deactivates.
- If the user is prompted to authenticate when the screen saver deactivates, the type of prompt depends on whether a smart card is inserted into the reader at that moment, and the type of card. If a single-user smart card is inserted into the reader, the user is prompted for the PIN associated with that card. If a multi-user smart card is inserted into the reader, the user is prompted for a name and password — note, however, that the **Password** box requires the PIN for the card, not the user account password.

If a card is not inserted in the reader, the user is not prompted for a password. The reason the screen saver was activated (smart card removal or idle time) has no effect on the type of prompt that is issued when the screen saver deactivates.

Do not use local users who conflict with Active Directory users

When you configure a user for a smart card be certain that the Active Directory username does not match that of a local user.

In general, to avoid potential conflicts, Centrify does not recommend creating a local user with the same username as an Active Directory user, although such a configuration does not necessarily cause problems. However, configuring a smart card user with the same name as a local user is inherently unstable and can cause unpredictable results.

For a standard login, a local user is always logged in instead of an Active Directory user of the same name because the local account database is checked for authentication before Active Directory. However, the authentication mechanism is different for smart card login, so the Active Directory user on the card will be authenticated instead of the local user, unless the local user has been configured explicitly for the smart card.

Although the Active Directory user is logged in, some commands and applications will look up and apply information for the local user because the Mac directory database is consulted before Active Directory. This means that some of the group policy settings for smart card will not be applied to the Active Directory user and the smart card will not operate properly.

How smart card log in works with fast user switching

Fast user switching enables a user to log in to a computer with a different account without logging out the first account. If a user is logged in with a smart card, fast user switching does not work.

If you want to switch to a different user, you must unplug the smart card to so. The following procedure shows how to work around the smart-card limitation on fast user switching.

To perform fast user switching when logged in with a smart card

1. With fast user switching enabled, log in to a Mac computer using a smart card — for this example, assume a single-user card provisioned with the name scuser.

2. Switch to a different, non-smart card account (for example, `normal1`) and enter the password.

The login fails for the new account and you are prompted for the smart card PIN.

3. Unplug the smart card.

If the **Lock smart card screen** is not enabled in the domain, the desktop for `normal1` is displayed.

If this policy is enabled, the screen is locked. You can unlock the screen by logging in as `normal1`.

Troubleshooting smart card log in

If you have problems with smart card logon, Access Manager provides a command-line tool, `sctool`, which you can run to configure smart card logon, as well as to provide diagnostic information. See [Understanding sctool](#) or the `sctool` man page.

Additional smart card diagnostic procedures are provided in [Diagnosing smart card log in problems](#).

Configuring web browsers and mail clients

The subsections in this section provide tips for configuring different web browsers and mail clients to work with Centrify Smart Card on Mac computers. The following topics are covered:

- [Using Microsoft Outlook 2011 for signed and encrypted mail](#)
- [Using Safari to access protected web sites](#)
- [Using Chrome to access protected web sites](#)
- [Enabling Firefox and Thunderbird to access protected web sites](#)

Using Microsoft Outlook 2011 for signed and encrypted mail

To use Outlook for Mac 2011 to send and receive encrypted email, you must have a valid digital certificate. After you have downloaded and imported the

appropriate intermediate certificates for your smart card, you can configure Microsoft Outlook 2011 to sign email with your certificate and send encrypted mail.

To send a digitally signed message:

1. Log on the Mac and open Microsoft Outlook.
2. On the Tools menu, click **Accounts**.
3. Select the account from which you want to send a digitally signed message.
4. Click **Advanced**, then click the **Security** tab.
5. Under **Digital signing**, click the **Certificate** menu, then select the certificate that you want to use.
6. Click **Include my certificates in signed messages** check box if all of your recipients have email that supports digital signing and encryption.
7. Click **OK**, then close the Accounts dialog box.
8. When composing email messages, click the Options tab, click Security, then click **Digitally Sign Message**.

To send an encrypted message:

1. Log on the Mac and open Microsoft Outlook.
2. On the Tools menu, click **Accounts**.
3. Select the account from which you want to send an encrypted message.
4. Click **Advanced**, then click the **Security** tab.
5. Under **Encryption**, click the **Certificate** menu, then select the certificate that you want to use.
6. Click **OK**, then close the Accounts dialog box.
7. When composing email messages, click the Options tab, click Security, then click **Encrypt Message**.

To send an encrypted message, you must have the public certificate of the user to whom you are sending the mail message. If the recipient is a contact in your address book, this certificate is typically available on the Certificates tab

in Outlook. If you do not have the certificate, Outlook will not create an encrypted mail message. However, if the name of the person matches a contact in your address book, Outlook encrypts the message before sending it.

For more information about managing digital certificates and sending and receiving encrypted email in Outlook for Mac 2011, see the Microsoft topic [How users manage digital certificates in Outlook for Mac 2011..](#)

Using Safari to access protected web sites

If you want to use a smart card to access restricted Web sites — such as those for the Department of Defense (DOD) — using Safari as your web browser, you should configure the certificate to use for authentication.

To configure a certificate for the smart card:

1. If you have Safari open, choose the Safari menu, then click **Quit Safari**.
2. Insert your smart card in the reader, then navigate to Utilities and open **Keychain Access**.
3. Select the provisioned CAC keychain for your smart card.
4. From Category list, select **My Certificates**.
5. Right-click the certificate you want to use to authenticate your identity. In most cases, you should select the **Authentication Private Key** certificate or the **Digital Signature Private Key** certificate, depending on the web site you want to view.
6. Select **New Identity Preference**.
7. Type the complete URL for the web site you want to access, then click **Add**. For example:

`https://akocac.us.army.mil/`

`https://www.jtfgno.mil/`

Using Chrome to access protected web sites

If you want to use a smart card to access restricted Web sites — such as those for the Department of Defense (DOD) — using Google Chrome as your web browser, you should configure the certificate to use for authentication.

To configure a certificate for the smart card:

1. If you have Chrome open, choose the Chrome menu, then click **Quit Google Chrome**.
2. Insert your smart card in the reader, then navigate to Utilities and open **Keychain Access**.
3. Select the provisioned CAC keychain for your smart card.
4. From Category list, select **My Certificates**.
5. Right-click the certificate you want to use to authenticate your identity. In most cases, you should select the **Authentication Private Key** certificate or the **Digital Signature Private Key** certificate, depending on the web site you want to view.
6. Select **New Identity Preference**.
7. Type the complete URL for the web site you want to access, then click **Add**. For example:

`https://akocac.us.army.mil/`

`https://www.jtfgno.mil/`

Enabling Firefox and Thunderbird to access protected web sites

Firefox and Thunderbird cannot be used with a smart card for secure browsing and e-mail signing because they require a PKCS#11 module and Centrify Management Services for Mac ships with Tokend only, not with PKCS#11. However, Apple provides an open-source module, TokenPKCS11.so, which can act as a shim between Tokend and PKCS#11. Centrify provides group policies that allow you to install the TokenPKCS11.so module to provide the PKCS#11 interface to Firefox and Thunderbird.

The following group policies, located in **User Configuration > Policies > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy**, enable Firefox and Thunderbird to be used with a smart card:

- **Allow NSSDB based applications to use smart card** allows NSSDB-based applications to use a smart card and adds Firefox and Thunderbird to the list of applications.
- **NSSDB based applications allowed to use smart card** loads the TokenPKCS11 module to the appropriate location for Firefox and Thunderbird.

To enable smart card use with Firefox and Thunderbird:

1. Enable the “Enable smart card support” policy:
Computer Configuration > Policies > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Enable smart card support
 Click **OK**.
2. Enable the “Allow NSSDB based applications to use smart card” group policy.
User Configuration > Policies > User Configuration > Policies > Centrify Settings > Mac OS X Settings > Security & Privacy > Allow NSSDB based applications to use smart card
 Click **OK**.
3. Open the “NSSDB based applications allowed to use smart card” group policy.
 This policy loads the TokenPKCS11 module to a specified location. Note that enabling “Allow NSSDB based applications to use smart card” automatically added the appropriate locations for Firefox and Thunderbird.
 Click **OK**.
4. In the Centrify configuration file, set the `smartcard.name.mapping` parameter to true.

This parameter allows the use of multi-user smart cards. See [Enabling support for multi-user PIV and multi-user smart cards](#) for more information.

5. In a Terminal window, run `adgpupdate` and `adrelload` to apply the group policy and configuration parameter changes.

To verify that Firefox and Thunderbird are configured for smart card users:

1. Use a smart card to log in to the computer.
2. Open Firefox (and Thunderbird) and click **Options > Advanced > Certificates > Security Devices**.
You should see the Centrify PKCS #11 Module.
3. Open Firefox (and Thunderbird) and click **Options > Advanced > Certificates > View Certificates > Authorities**.
You should see U.S. Government.
4. Open Firefox, type and type `https://10.100.2.133` in the address bar.
You are prompted to select the certificate.
5. After selecting the certificate, the web page should load successfully.
6. Open Thunderbird and configure smart card e-mail.
You should be able to send encrypted e-mail and decrypt encrypted e-mails from other users.

Managing a Mac that is joined and enrolled

You have two distinct methods of managing OS X devices:

- Enroll Mac devices in the Centrify Identity Services and manage them through the Admin Portal.
- Install the Centrify UNIX agent and join the device to Active Directory, then manage it through the Group Policy Management Editor.

Although it is typical to choose one method or the other to manage a Mac device, it is possible to use the tools available in both environments to manage the device.

The following topics describe the behavior that you can expect when you leverage both the Admin Portal and Group Policy Management Editor to manage Mac devices.

Joining a Mac to a domain and enrolling it in the Centrify Identity Services

This topic shows you how to join a Mac computer to a domain and then enroll it in the Centrify Identity Services. An Active Directory administrator typically performs this procedure, assigning the computer to a different Active Directory user account during the enrollment process.

The assigned user is added to the Centrify Identity Services as the device owner and is able to view and manage the enrolled computer through the Centrify User Portal. An Centrify Identity Services administrator can assign the user to one or more roles that determine the applications, permissions, and policies that apply to the user on this computer.

Before you begin, have the following items in place:

- User name and password for an administrative account on the Mac computer to allow Centrify Join Assistant to make changes.
- User name and password for an Active Directory account that has permissions to join a domain (for example, a domain admin).
- User name and password for an account that is a member of the System Administrator role or a role with the Device Enroll on Behalf Of administrative right.
- Apple Push Notification Service (APNS) certificate uploaded to Cloud Manager.

Refer to [Creating an APNS certificate](#) in the Cloud Manager online help for more information.

Join an Active Directory domain

1. Launch the Centrify Join Assistant.

There are two ways to launch the Centrify Join Assistant:

- from the Centrify agent installer, as described in [Installing the Centrify agent](#)
- click **Applications > Utilities > Centrify**, double-click **Centrify Join**

Assistant to open it, then click **Continue** on the Welcome page

Centrify Join Assistant

Please enter the name of your Active Directory domain to join, and an Active Directory administrator's username and password.

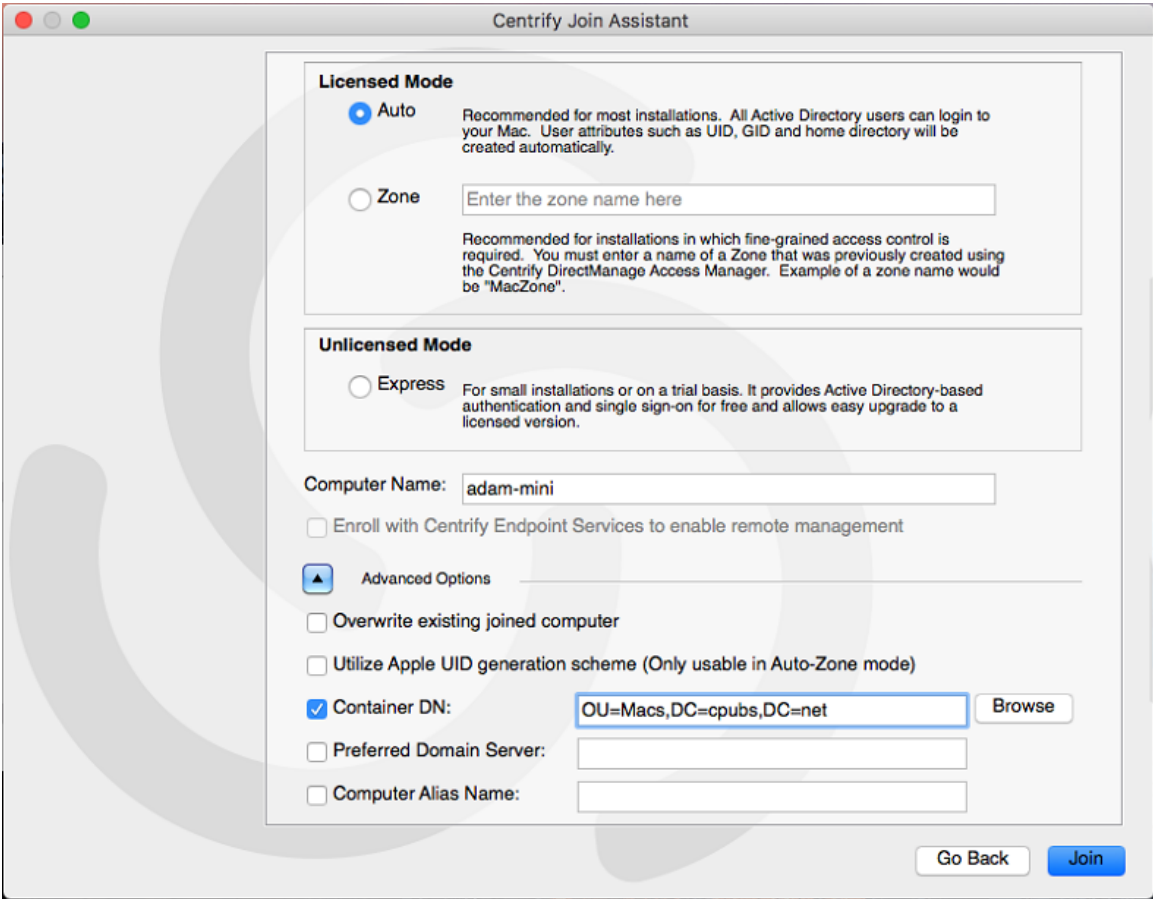

Active Directory Domain:

Active Directory Username:

Active Directory Password:

2. Enter the active directory domain that you want to join as well as administrator credentials for that domain, then click **Continue**.

A page appears that allows you to select how to join the domain with an option to enroll in the Centrify Identity Services.

3. Select from the following options:

Select this option	To do this
Express	Joins a domain using a free version of Centrify called Centrify Express that does not include licensed features, such as group-policy enforcement, zone-based access control, and smart card login to Active Directory.
Auto	Joins the computer through Auto Zone, which allows joining a computer with little or no configuration. This option is recommended for most installations.
Zone	Joins to the zone that you type in the box. Note that you must have created at least one zone before you can use this option.
Computer name	Defaults to the name of the computer on which you are running the join assistant, but you can change it if you want to use a different name for the local host in Active Directory.
Enroll	Provides an opportunity to download the Centrify Agent for Mac,

Select this option	To do this
	<p>which you can use to enroll the computer.</p> <p>If you select this option, Centrify Join Assistant provides a download button to download the Centrify Agent for Mac.</p>

4. (Optional) Click the arrow to expand the Advanced Options and select any Advanced Options that you want to use to join the device.

Select this option	To do this
Overwrite existing joined computer	<p>Overwrite the information stored in Active Directory for an existing computer account. This option allows you to replace the information for a computer previously joined to the domain. If there is already a computer account with the same name stored in Active Directory, you must use this option if you want to replace the stored information. You should only use this option when you know it is safe to force information from the local computer to overwrite existing information.</p> <p>Checking this option is the same as running the <code>adjoin</code> command with the <code>--force</code> option.</p>
Container DN	<p>Specify the distinguished name (DN) of the container or Organizational Unit in which you want to place this computer account.</p> <p>By default, computer accounts are created in the domain's default Computers container.</p> <p>Click Browse to browse Active Directory and select the container to use, or click Container DN and enter the name of the container in distinguished name format; for example, if the domain suffix is <code>acme.com</code> and you want to place this computer in the <code>paris.regional.sales.acme.com</code> organizational unit, you would type:</p> <p><code>ou=paris, ou=regional, ou=sales</code></p> <p>Checking this option is the same as running the <code>adjoin</code> command with the <code>--container</code> option.</p>

Select this option	To do this
Preferred Domain Server	<p>Specify the name of the domain controller to which you prefer to connect. You can use this option to override the automatic selection of a domain controller based on the Active Directory site information.</p> <p>Checking this option is the same as running the <code>adjoin</code> command with the <code>--server</code> option.</p>
Computer Alias Name	<p>Specify an alias name you want to use for this computer in Active Directory. This option creates a Kerberos service principal name for the alias and the computer may be referred to by this alias.</p> <p>Checking this option is the same as running the <code>adjoin</code> command with the <code>--alias</code> option.</p>

5. Click **Join**.

Centrify Join Assistant informs you that you have successfully joined your Mac to your Active Directory domain at `<mydomain.com>`.

If you selected the option to enroll the computer, you will see a download button to download the Centrify Agent for Mac, which you can use to enroll the computer.

6. Click **Download** to download the Centrify Agent for Mac.

Enroll the Mac in the Centrify Identity Services

1. Open the `CIS-Mac-Agent.dmg` file, then double-click the `CIS-Mac-Agent.pkg` file.

The installer for Centrify Agent for Mac opens.

2. Click through the on-screen instructions, agreeing to the software license agreement and entering administrator credentials when necessary.

After the installation completes, you can choose to launch the agent.

3. Select **Launch Centrify Agent**, then click **Continue**.

The Sign In window appears.

4. Enter the user credentials for an admin user in a role with the Device

Enroll On Behalf Of administrative right assigned.

Refer to [Admin Portal administrative rights](#) for more information.

5. Click **Enroll this mac for a different user**.

The Enroll this mac for a different user window appears.

6. Select how the user will log in to the Mac.

Choose a local user that exists only on the Mac device or a user managed by Active Directory.

7. Complete the User to Enroll and Account Name fields, then click **Enroll**.

- In the User to Enroll field, enter the username and domain suffix that the user will use to log in to the user portal.

For example, *myuser@mydomain.com*.

- In the Account Name menu, select the username for the account associated with the user.

For example, *myuser*.

You can click the arrows in the menu to see a list of all users (either local users or users in the domain that the device is joined to) or start typing the username to filter the list. If you don't see the account associated with the user, make sure the user exists or your device is joined to the AD domain.

8. Enter the admin credentials of the local admin user on the Mac when prompted, then click **Close** once enrollment is complete.

Enrolling a computer that is already joined to a domain

You can use the Centrify Join Assistant to download the Agent for Mac and enroll a computer that is already joined to a domain. Typically, an Active Directory administrator performs this procedure, but assigns the computer to a different Active Directory user account. The assigned user is added to the Centrify Identity Services as the device owner and is able to view and manage the enrolled computer through the Centrify User Portal. A Centrify Identity Services administrator can assign the user to one or more roles that determine the applications, permissions, and policies that apply to the user on this computer.

Before you begin, have the following items in place:

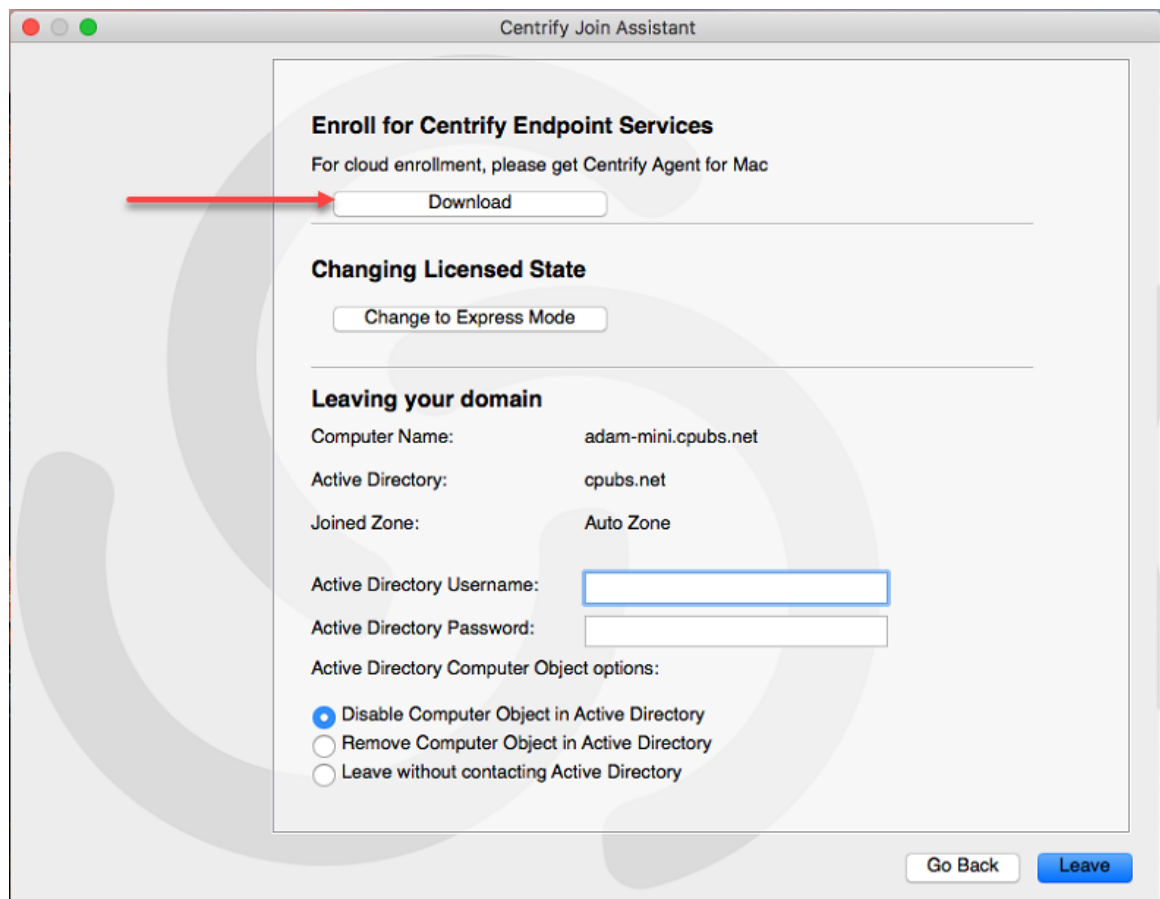

- User name and password for the administrative account on the Mac computer to allow the Centrify Join Assistant and the Agent for Mac to make changes.
- Apple Push Notification Service (APNS) certificate uploaded to the Admin Portal.
Refer to [Generating an APNS certificate](#) in the Admin Portal online help for more information.
- User name and password for an account that is a member of the System Administrator role or a role with the Device Enroll on Behalf Of administrative right.

To use Centrify Join Assistant to enroll a joined computer in the Centrify Identity Services

1. In the Finder, launch the Centrify Join utility by clicking **Applications > Utilities > Centrify**, then double-click **Centrify Join Assistant** to open it. Click **Continue** on the Welcome page.
2. Enter the name and password for an administrator's account on the computer and click **OK**.

Centrify Join Assistant displays information about the domain to which the computer is joined:

3. Click **Download** to download the Centrify Agent for Mac.
4. Select **Launch Centrify Agent**, then click **Continue**.

The Sign In window appears.

5. Enter the user credentials for an admin user in a role with the Device Enroll On Behalf Of administrative right assigned.

Refer to [Admin Portal administrative rights](#) for more information.

6. Click **Enroll this mac for a different user**.

The Enroll this mac for a different user window appears.

7. Select how the user will log in to the Mac.

Choose a local user that exists only on the Mac device or a user managed by Active Directory.

8. Complete the User to Enroll and Account Name fields, then click **Enroll**.
 - In the User to Enroll field, enter the username and domain suffix that the user will use to log in to the user portal.

For example, *myuser@mydomain.com*.

- In the Account Name menu, select the username for the account associated with the user.

For example, *myuser*.

You can click the arrows in the menu to see a list of all users (either local users or users in the domain that the device is joined to) or start typing the username to filter the list. If you don't see the account associated with the user, make sure the user exists or your device is joined to the AD domain.

9. Enter the admin credentials of the local admin user on the Mac when prompted, then click **Close** once enrollment is complete.

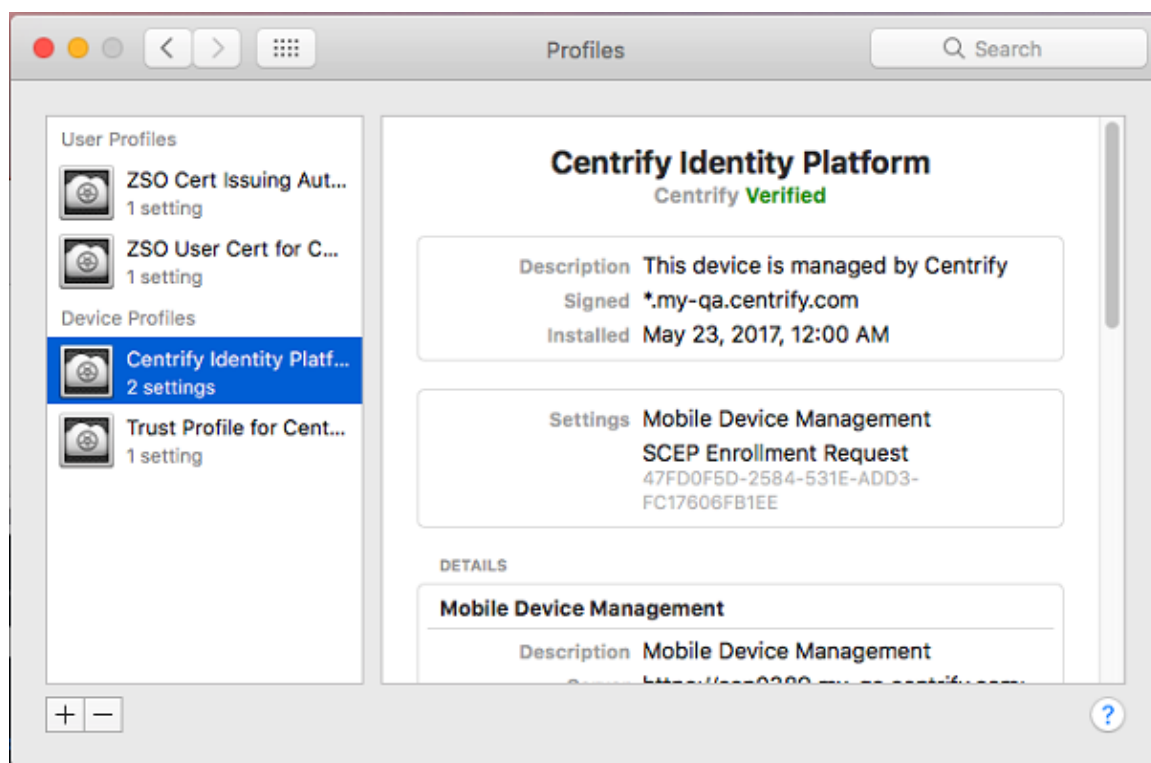

What happens after a joined computer is enrolled with Centrify Identity Services?

When a user or administrator enrolls a computer in the Centrify Identity Services, the identity platform installs a mobile device management (MDM) profile on the computer that allows a Centrify Identity Services administrator to manage the computer through policy settings. The profile is installed in the System Preferences panel on the computer. You can use the following procedure to verify that the MDM profile was installed.

To see the installed MDM profile

1. On the Mac computer, click **Apple menu > System Preferences**.
2. In System, double-click **Profiles**.

You should see the following profiles:

Profile	Settings
Centrify Identity Services	<ul style="list-style-type: none"> Mobile Device Management (MDM) Scroll down to display privileges that were set by your IT department. SCEP (Simple Certificate Enrollment Process) Enrollment Request. Scroll down to display the Centrify Identity Services certificate information.
Trust Profile for Centrify Customer <customer ID>	<ul style="list-style-type: none"> Certificate Scroll down to display the certificate information.
ZSO Cert Issuing Authority	<ul style="list-style-type: none"> Certificate Scroll down to display the certificate information.
ZSO User Cert	<ul style="list-style-type: none"> Certificate Scroll down to display the certificate information.

You cannot modify the Centrify MDM profile in any way. If you delete it, the computer will be unenrolled from the Centrify Identity Services. Likewise, if you, or someone else, unenrolls the computer from the Centrify Identity Services, the Centrify Identity Services deletes the profiles from the computer.

Enrolling a joined Mac in the Centrify Identity Services is transparent to an administrator who is already managing the computer through the Centrify UNIX agent (`adclient`). Furthermore, enrolling a joined computer does not change the status of the computer object in Active Directory nor affect the UNIX agent running on the computer.

Note The enrollment process does not update the password for the computer account. The password is created and maintained by Centrify Identity Services through the UNIX agent on the computer.

What happens after a joined computer is unenrolled from the Centrify Identity Services?

If you unenroll a jointly managed computer from the Centrify Identity Services, the configuration profiles are removed from the computer. However, this action has no effect on the Centrify UNIX agent, which remains connected to the domain, and there is no change to the status of the computer object in Active Directory.

If an Active Directory administrator removes a jointly managed computer from Active Directory, there is no effect on the computer in the Centrify Identity Services. The computer remains enrolled.

How do I manage group policies for joined and enrolled Macs?

Although Centrify Identity Services enforces a set of Mac-specific group policies, these settings might conflict with the settings enabled through the Centrify agent. If there is a conflict, the policies set and enforced through the Centrify agent always take precedence.

Managing an enrolled computer with identity platform interfaces

After a joined computer is enrolled in the Centrify Identity Services platform, it can be managed through the Admin Portal and user web-portals as well as through Access Manager and command-line tools. The identity platform provides the following interfaces:

- The **Centrify Admin Portal**, a web interface for administrators to manage mobile devices, including Mac computers. See the [Cloud Manager help](#) for more information.
- The **Centrify User Portal**, a web interface for users to administer their mobile devices, including Mac computers. See the [user portal help](#) for more information.
- The **Centrify mobile ADUC extension**, an Active Directory Users and Computers (ADUC) snap-in that displays mobile-specific properties for mobile devices, including Mac computers, and provides commands to manage enrolled devices and computers.
- The **Centrify mobile group policy extension**, a Group Policy Management Editor (GPME) extension that offers mobile-specific policies when creating group policies for mobile devices, including Mac computers.

Note If you want to add the mobile-specific menus and group policy extensions to your Active Director Users and Computers installation, you can run the Centrify Cloud Management installer on your Windows ADUC computer and install just these extensions. Note that after installing the mobile-specific menus, you won't be able to use them unless the cloud administrator authorizes you to do so.

When you enroll a computer with the Centrify Agent for Mac, it installs the Centrify User Portal application in the Applications folder. This application provides zero-sign on access to the Centrify User Portal. If the user logged in to the computer is the same user that the computer was enrolled for, launching the application opens a browser and logs the user into the Centrify User Portal without the need to enter a password. If a different user has logged into the computer, the application opens the sign-in page for the user portal, allowing a user to provide an Active Directory user name and password.

Troubleshooting tips

This section provides troubleshooting tips for administrators using the Centrify agent on Mac computers.

The following topics are covered:

- Using common account management commands
- Viewing the Centrify agent version on the Macs joined to Active Directory
- Enabling logging for the Centrify agent
- Enabling logging for the Mac Directory Service
- Using the Centrify agent on a dual-boot system
- Using `adgpupdate` appropriately
- Understanding delays when logging on the first time with a new user account
- Configuring single-sign on to work with non-Mac computers
- Restricting login using FTP
- Logging on using localhost
- Changing the password for Active Directory users
- Disabling Apple's built-in Active Directory plug-in
- Showing the correct status of the Centrify plug-in
- Resolving VPN access issues with Mac OS X 10.7 and later
- Diagnosing smart card log in problems
- Opening a support case online
- Collecting information for support cases

Using common account management commands

Most UNIX-based platforms store account information in the local `/etc/passwd` file, and use commands such as `getent` command to query that information. On Mac computers, however, you would typically use the Directory Service application to manage local accounts and retrieve user information. For troubleshooting purposes, therefore, you should be familiar with the commands to use for retrieving information about Active Directory users and groups.

The following table describes several common Directory Service Command Line (`dsc1`) commands that you may find useful.

Use this command	To do this
<code>dsc1 /Search -list /Users</code>	List all of the users in the Directory Service and in Active Directory for the zone.
<code>dsc1 /CentrifyDC -list /Users</code>	List only the Active Directory users enabled for the zone.
<code>dsc1 /CentrifyDC -read /Users/<i>username</i></code>	Display detailed information about the specified Active Directory <i>username</i> .
<code>dsc1 /Search -list /Groups</code>	List all of the groups in the Directory Service and in Active Directory for the zone.
<code>dsc1 /CentrifyDC -list /Groups</code>	List only the Active Directory groups enabled for the zone.
<code>dsc1 /CentrifyDC -read /Groups/<i>groupname</i></code>	Display detailed information about the specified Active Directory <i>groupname</i> .

To get detailed information for all users or groups recognized on the Mac computer, you can use the following commands:

```
lookupd -q user -a name
```

```
lookupd -q group -a name
```

To get detailed information for a specific user or group, you can use the following commands:

```
lookupd -q user -a name username
```

```
lookupd -q group -a name groupname
```

To clear the Directory Service cache, you can use the following command:

```
lookupd -flushcache
```

• • • • •

To completely clear the cache of Active Directory login credentials, you should also run the `adflush` command:

```
adflush
```

To retrieve Mac OS version and build information that `uname -a` does not provide, you can run the following command:

```
/usr/bin/sw_vers
```

Viewing the Centrify agent version on the Macs joined to Active Directory

You can use the Active Directory module for Windows PowerShell to view the version of the Centrify agent on the Macs joined to your AD domain. This is useful to verify that all Macs joined to your AD have an appropriate version of the Centrify Agent to avoid compatibility issues with OS updates.

Install the Active Directory module for Windows PowerShell

The Active Directory module for Windows PowerShell is already installed on domain controllers. If you are using a member server, you will have to install it.

To install the Active Directory module for Windows PowerShell

Open an elevated PowerShell session on a Windows server in the domain and run the following command:

```
Add-WindowsFeature RSAT-AD-PowerShell
```

When the installation finishes it returns the following:

```
PS C:\Windows\system32>
PS C:\Windows\system32>
PS C:\Windows\system32> Add-WindowsFeature RSAT-AD-PowerShell

Success Restart Needed Exit Code      Feature Result
-----
True     No                Success      {Active Directory module for Windows Power...
```

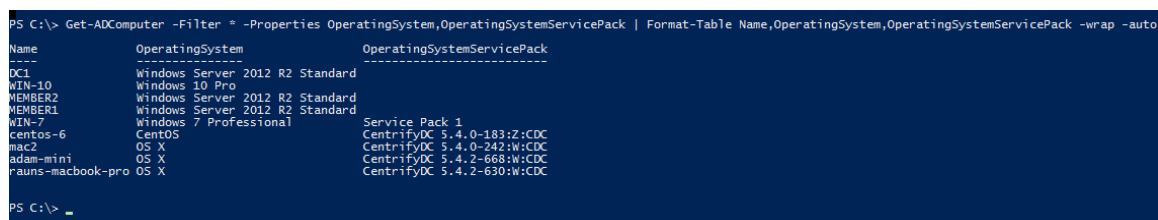

Once installed, on Windows Server 2012 and 2012 R2 the module automatically loads when you use one of its cmdlets; you do not need to import it.

Show PowerShell output of Centrify agent versions for AD-joined computers

If you have a small environment, or just want to see a sample of the information that will be in the report, run the following from a Windows server with the AD PowerShell module installed:

```
Get-ADComputer -Filter * -Properties  
OperatingSystem,OperatingSystemServicePack | Format-Table  
Name,OperatingSystem,OperatingSystemServicePack -wrap -auto
```

For example:

```
PS C:\> Get-ADComputer -Filter * -Properties OperatingSystem,OperatingSystemServicePack | Format-Table Name,OperatingSystem,OperatingSystemServicePack -wrap -auto
```

Name	OperatingSystem	OperatingSystemServicePack
DC1	Windows Server 2012 R2 Standard	
WIN-10	Windows 10 Pro	
MEMBER2	Windows Server 2012 R2 Standard	
MEMBER1	Windows Server 2012 R2 Standard	
WIN-7	Windows 7 Professional	Service Pack 1
Centos-6	CentOS	CentrifyDC 5.4.0-183:Z: CDC
mac2	OS X	CentrifyDC 5.4.0-242:W: CDC
adam-mini	OS X	CentrifyDC 5.4.2-668:W: CDC
rauns-macbook-pro	OS X	CentrifyDC 5.4.2-630:W: CDC

The report includes all AD-joined computers in the domain. The example above shows a mix of Windows, Linux, and Mac computers. Where `operatingsystemservicepack` is empty, it means there is no Service Pack installed (Windows computers), or there is no Centrify agent installed (Mac or Linux/Unix).

In most cases there are too many computers for the PowerShell output to be easily readable. In these cases, you will want to [Export the report of Centrify agent versions to a CSV file](#).

Export the report of Centrify agent versions to a CSV file

You can export a report of Centrify agent versions on AD-joined computers to a CSV file for easier manipulation by running the following:

```
Get-ADComputer -Filter * -Properties  
OperatingSystem,OperatingSystemServicePack | Select-Object  
Name,OperatingSystem,OperatingSystemServicePack | Export-  
CSV CDCVersion.csv -NoTypeInformation -Encoding UTF8
```

In this example, PowerShell exports the data shown in [Show PowerShell output of Centrify agent versions for AD-joined computers](#) to a CSV file named `CDCversion.csv` in the current directory. You can then open that CSV file using a spreadsheet application such as Excel to more easily analyze the data.

Enabling logging for the Centrify agent

The Centrify agent installation includes some basic diagnostic tools and a logging mechanism to help you trace the source of problems if they occur. These diagnostic tools and log files allow you to periodically check your environment and view information about the agent operation, your Active Directory connections, and the configuration settings for individual computers.

In most cases, logging is not enabled by default for performance reasons. Once enabled, however, log files provide a detailed record of Centrify agent activity and can be used to analyze the behavior of Centrify Management Services and communication with Active Directory to locate points of failure.

To enable logging on the Centrify agent:

1. Log in as or switch to the root user.
2. Run the `addebug` command:

```
/usr/local/share/centrifydc/bin/addebug on
```

Note You must type the full path to the command because `addebug` is not included in the path by default.

Once you run this command, all of the agent activity is written to the `/var/log/centrifydc.log` file. If the `adclient` process stops running while you have logging on, the `addebug` program records messages from PAM and NSS requests in the `/var/centrifydc/centrify_client.log` file. Therefore, you should also check that file location if you enable logging.

By default, agent logging uses the Macintosh's logging system, which does not capture some important logging information. To guarantee that you capture all agent logging information, complete the following additional steps to direct logging to a specific file.

3. Stop the `syslogd` service:

.....

```
service com.apple.syslogd stop
```

4. Open the file, `/etc/centrifydc/centrifydc.conf`, with a text editor, find the parameter and value, `logger.destination:syslog`, then change the value as follows to direct logging output to the file, `/var/log/logfile.log`:

```
logger.destination:/var/log/logfile.log
```

5. Restart the agent:

Note `/usr/local/share/centrifydc/bin/centrifydc restart`

Note For more information about starting and stopping the agent, see the *Administrator's Guide for Linux and UNIX*.

For performance and security reasons, you should only enable agent logging when necessary, for example, when requested to do so by Centrify Corporation Technical Support, and for short periods of time to diagnose a problem. Keep in mind that sensitive information may be written to this file and you should evaluate the contents of the file before giving others access to it.

When you are ready to stop logging activity, run the `addebug off` command.

Enabling logging for the Mac Directory Service

In addition to enabling logging for the agent, you may find it necessary to enable logging for the Open Directory Service.

To create a log file for the Open Directory Service:

1. Log in as or switch to the root or admin user.
2. Run the following command:

```
odutil set log debug
```

After running this command, you can find the resulting log files at: `/var/log/opensDirectoryd.log*`. You can then provide both the agent log file and the Directory Service log file to Centrify Support if you need assistance troubleshooting issues.

Using the Centrify agent on a dual-boot system

If you are using a dual-boot system, and the computer name is the same for each version of the operating system, the Centrify agent (`adclnt`) will not launch when you reboot and switch operating systems. The problem is that each operating system sets its own password for `adclnt` and the password does not work for the other operating system.

The best way to avoid this problem is to provide a different computer name for each operating system. Because the computer names are different, the password for one operating system is not changed by the other operating system.

If you want to use the same computer name for both operating systems, you can work around the problem, as follows:

1. Leave the domain (`adleave`) before rebooting and switching operating systems.

Note You may leave and join the domain after rebooting and switching the operating system. However, you will experience some delay while `adclnt` attempts to launch and fails.

2. Reboot with the other operating system.
3. Rejoin the domain (`adjoin`).

Using `adgpupdate` appropriately

If `adgpupdate` is run multiple times in succession, it is possible that not all group policies will be applied correctly. To avoid this problem, do not run `adgpupdate` more than once per minute.

Understanding delays when logging on the first time with a new user account

Depending on the configuration of your startup services, you may find that new users are unable to log on to a computer immediately (within the first 15 to 30 seconds) after a computer is rebooted.

• • • • •

By default, the Mac login window only requires the `Disk` and `SecurityService` startup services to start successfully to prompt for the user to log in. Authenticating users to Active Directory, however, requires the additional `DirectoryServices` startup service to be available. Starting the `DirectoryServices` startup service causes a 10 to 15 second delay before the Login window can successfully authenticate new Active Directory users.

Configuring single-sign on to work with non-Mac computers

On a Mac computer, the `ssh` client does not forward (delegate) credentials to the server by default. Therefore, when attempting to use `ssh` from a Mac computer with Centrify agent installed to a non-Mac computer with Centrify agent installed, single sign-on (SSO) does not work. To fix this problem, set the configuration parameter, `GSSAPIDelegateCredentials`, to `yes` in the `/etc/ssh_config` file on the Mac computer.

Restricting login using FTP

In Active Directory, you can set properties to prevent a user from logging in to other Macintosh computers. However, this restriction will not prevent a user from logging in via FTP to Macintosh computers with the Centrify agent installed. It does restrict logging in with `telnet`, `ssh`, `rlogin`, and `rsh`.

Logging on using localhost

For many UNIX platforms, you can log on using `localhost` to refer to the local computer; for example:

```
root@localhost
```

This syntax does not work when logging on to a Macintosh computer, whether using the Macintosh UI, or remotely through `ssh` or FTP.

Changing the password for Active Directory users

In the Mac OS X, the `passwd` command authenticates the user only after you type the user password. Because of this, the `passwd` command does not recognize the user as an Active Directory user until after the password is entered and the password prompts defined for Active Directory users, which are typically set through group policy or by modifying the Centrify configuration file, are not displayed. You can still use the `passwd` or `chpass` command to change the Active Directory password for a user, but you will not see any visual indication that you are modifying an Active Directory account rather than a local user account.

Disabling Apple's built-in Active Directory plug-in

Apple provides a built-in Apple Directory plug-in that may interfere with the Centrify agent installation and operation. Therefore, before installing the agent, disable Apple's built-in Active Directory plug-in. In addition, remove Active Directory from the Authentication and Contacts search paths. If this plug-in is enabled and the Centrify agent has been installed, disable the plug-in, then reboot the Macintosh computer for reliable Centrify operation.

To disable the Apple Directory plug-in and remove Apple Directory from the Authentication and Contacts search paths:

1. On a Mac computer, open the Directory Utility.
You can find the Directory Utility in one of these folders depending on the operating system that you are running:
 - `/System/Library/CoreServices`
 - `/Applications/Utilities`
2. Click the lock icon and enter credentials to allow you to make changes.
3. Click the **Search Policy** icon.
4. Click the **Authentication** tab, then select Custom path in the **Search** box.

If Active Directory was previously enabled, Active Directory appears in the Directory Domains box; for example:

```
/Active Directory/All Domains
```

5. Select **/Active Directory/All Domains** and click **Remove** — or select the minus (-) sign). Then click **Apply**.
6. Click the **Contacts** tab, then select Custom path in the **Search** box. If Active Directory was previously enabled, Active Directory shows (in red font) in the Directory Domains box; for example:

```
/Active Directory/All Domains
```

7. Select **/Active Directory/All Domains** and click **Remove**. Then click **Apply**.
8. Close the window.
9. If you have already installed the Centrify agent, reboot the computer.

Showing the correct status of the Centrify plug-in

The Centrify plug-in is automatically added to the list of Apple Directory Utility plug-ins that are used for lookup and authentication. However, if the Apple Directory Utility tool is running when you install the Centrify agent, or when you join or leave a domain before updating to a new version of the agent, it will incorrectly display the status of the plug-in. For example, it will show the status as disabled, when in fact, the plug-in is enabled.

To avoid this problem, before launching the installer, be certain that the Apple Directory Utility tool is closed.

If the Directory Utility was open during installation, simply close and re-open Directory Utility, then make certain that the Centrify plug-in is enabled.

You may also restart the Centrify plug-in from the command line, as follows:

1. Close the Directory Utility.
2. Open a terminal.

• • • • •

3. Enter the following command:

```
/usr/local/share/centrifydc/bin/dsconfig restart
```

4. Open the Directory Utility. The status of Centrify should be enabled.

Resolving VPN access issues with Mac OS X 10.7 and later

Starting with Mac OS X 10.7, `/etc/resolv.conf` is no longer used for domain controller name resolution. Therefore, some VPN programs no longer update DNS server information in `/etc/resolv.conf` when signing on. On computers running Mac OS X 10.7 and later, this can result in the computer not being able to connect to a domain controller through a VPN.

To resolve this issue, explicitly specify in `centrifydc.conf` the location of DNS servers that are used to resolve domain controller names:

1. Open `/etc/centrifydc/centrifydc.conf` for editing.
2. Specify the IP addresses of DNS servers in the `dns.servers` parameter (if the parameter does not exist yet, create it now):
`dns.servers: x.x.x.x y.y.y.y`
where `x.x.x.x y.y.y.y` are the IP addresses of the DNS servers to use. This example shows two IP addresses; note that each IP address is separated by a space.
3. Save your changes to `centrifydc.conf`.
4. Restart the agent for the changes to take effect:

```
sudo /usr/local/share/centrifydc/bin/centrifydc restart
```

Diagnosing smart card log in problems

Two general methods for diagnosing smart card log in problems are provided:

- By using the `sctool` utility as described in [Using sctool](#)
- By performing the diagnostic procedures described in this section.

The following procedures are intended to diagnose multiple causes of smart card log in failure. It is recommended that you retest smart card login at regular intervals (such as after each step) as you perform this procedure.

1. Ensure that the Mac computer is able to recognize the smart card. To do so, open Keychain Access and insert the smart card into the reader. The card should appear in the Keychain Access window as another Keychain with its certificates loaded.

If the smart card does not appear in the Keychain window:

- a. Ensure that the firmware of the smart card reader has been updated to the latest version.
- b. Ensure that no other conflicting smart card drivers have been installed. Centrify Infrastructure Services ships with CAC, CACNG, PIV, and BELPIC drivers by default. Other drivers, such as Gemalto, are incompatible with some cards. Check `/var/log/system.log` to see if non-default (and possibly incompatible) drivers were installed. Log entries for smart card drivers appear similar to the following:

```
reader SCM SCR inserted token "First.Last.100xxxx"
subservice 12 using driver com.gemalto.tokenid
```

If non-default drivers are present, locate them in `/System/Library/Security/tokenid` and use the `sudo mv` command to remove them.

2. If the card is visible in Keychain Access, select **Certificates** under **Category** in the Keychain Access window and verify that the certificate trust chains for each certificate are valid all the way up the chains.
3. If a PIN prompt does not appear when the smart card is inserted, go to [Smart card PIN prompt does not display](#) and perform the procedure described there. When you are done, return to this procedure if you need to continue to diagnose smart card problems.
4. Ensure that there are no remaining objects from previous smart card insertions by clearing out the smart card token cache. To do so, log in as the local Administrator and execute the following command in a terminal window:

```
sudo rm -rf /var/db/TokenCache/tokens/*
```

5. Online Certificate Status Protocol (OCSP) in Mac can cause unexpected behavior in some environments. Disable OCSP by executing the following command in a terminal window:

```
sudo sctool -r -t ocsp:none -t crl:best -p crl
```

6. If logins still fail with OCSP disabled, set Certificate Revocation List (CRL) to **Off** as described in [Smart card PIN prompt does not display](#).

If the PIN prompt appears when CRL checking is **Off**, but not when set to **Best Attempt**, the CRL in the environment has expired. Update to a valid CRL and set CRL checking back to **Best Attempt**.

7. The Mac login window display mode can produce different behaviors with smart card logins, especially between different versions of Mac OS X 10.7.x.

To check for this issue, go to **System Preferences > Users & Groups > Login Options > Display login window as**. Try each of the following options to see if either allows the PIN prompt to display:

- List of users
- Name and password

8. Insert the smart card and execute the following command in a terminal window:

```
sctool -D
```

This command lists all the certificates present on the smart card and how their attributes match against Active Directory

- a. Ignore any certificate that displays `This certificate cannot be used for pkinit`, as such certificates are not applicable for system logins.
- b. Make sure that the user for the applicable certificate can be found in Active Directory through the user's principal name, and that the user has been authorized for logging in to the Zone.
- c. If the message `Cannot locate NT principal name in AD` is displayed for a certificate that can be used for pkinit, make sure the user has been configured correctly in Active Directory Users and Computers.
- d. Make sure that the UPN and alternate UPN of the Active Directory account have been configured correctly in Active Directory Users and Computers.
- e. If the UPN on the smart card is something other than `mil`, make sure that the `adclient.altupns` parameter in

/etc/centrifydc/centrifydc.conf has been configured accordingly. For example, if the UPN on the smart card is 111111@mysmartcard.local, the parameter should be configured as adclient.altupns: mysmartcard.local. This parameter can also be set through the group policy **Computer Configuration > Policies > Centrify Settings > DirectControl Settings > Add centrifydc.conf properties**.

- f. In Active Directory Users and Computers, expand **DomainName > Users**. In the list of users, right-click the user who is attempting to log in, and select **Properties**. Select the **Account** tab in the Properties dialog and verify that the name in the **User logon name** field matches the NT Principal Name on the smart card.
9. If the preceding steps have been verified and smart card logins still fail, there might be a compatibility issue between the smart card and the Mac OS itself. See the following Security Notes from Apple detailing the smart card compatibility fixes as of Mac OS X 10.9 Mavericks:
<https://support.apple.com/en-us/HT202854> (Security - Smart Card Services)
10. If necessary, contact Centrify Support and provide the information described in [Collecting information specific to smart card log in failure](#).

Smart card PIN prompt does not display

If no PIN prompt is shown when a smart card is inserted, and you have verified that smart card support is enabled through the Centrify Smart Card Assistant, and the smart card certificates appear in Keychain Access and are all fully trusted, perform the procedure described in this section.

Starting with release 10.7, Mac OS X does not ship with the configuration file (/Library/Preferences/com.apple.security.revocation) that holds the system-wide certificate revocation settings. The login window behavior when a smart card is inserted is dependent on this file. When the file is missing, no PIN prompt will be shown.

Note The Smart Card Assistant will show all settings as “Off” when this file is missing, which might not be the actual state of the configuration.

1. Execute the following command in a terminal window to check whether the configuration file is present:

```
sudo defaults read
/Library/Preferences/com.apple.security.revocation
```

If the configuration file is not present, the following message is shown:

```
Domain com.apple.security.revocation.plist does not
exist
```

2. Generate the configuration file by manually applying a change in the Smart Card Assistant, or by executing the following command in a terminal window:

```
sudo sctool -r -t ocsp:none -t crl:best -p crl
```

3. Rerun the command from Step 1 to verify that the file was generated. You should now see results similar to the following:

```
{
  CRLStyle = BestAttempt;
  CRLSufficientPerCert = 1;
  OCSPStyle = None;
  OCSPSufficientPerCert = 1;
  Revocation = CRL;
}
```

4. If the PIN prompt still does not appear when you insert a smart card, in the Smart Card Assistant set Certificate Revocation List (CRL) checking to **Off** and test again.

If the PIN prompt appears when CRL checking is **Off**, but not when set to **Best Attempt**, the CRL in the environment has expired.

Update to a valid CRL and set CRL checking back to **Best Attempt**.

Note CRL behavior on Mac differs from that on Windows, in which the smart card is still accepted even if the CRL has expired.

5. In the Smart Card Assistant, it is recommended that you keep the Online Certificate Status Protocol (OCSP) setting of **Off**. Settings other than **Off** can cause the PIN to not be shown again.
6. If you performed this procedure as part of the overall smart card diagnostic procedure, return to [Diagnosing smart card log in problems](#) and continue from there.

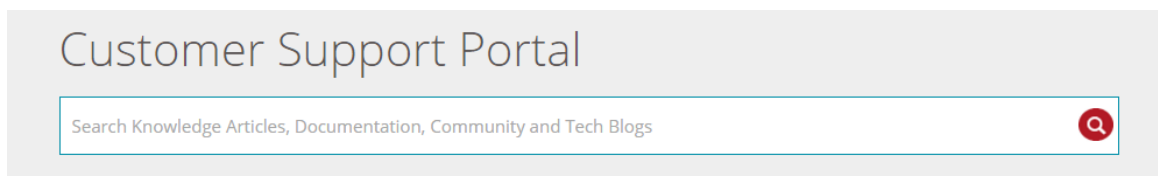

Opening a support case online

If you need assistance with troubleshooting an issue, you may need to open a case with Centrify Support.

Before opening a new case, Centrify recommends searching the Centrify Support Portal to see if your problem is a known issue or something for which there is a recommended solution.

To search the Centrify Support Portal

1. Open <https://www.centrify.com/support/> in a Web browser.
2. Click in the search field and type one or more key words to describe the issue, then click the search icon to view potential answers to your question.

If your issue is not covered in one of the search results, you should open a case with Centrify Support.

To open a new support case

1. Log in to the Centrify support portal.
2. Click **Manage Cases**, then click **Open a New Support Case**.

The NEW CASE DETAIL page appears.

3. Enter your case details, then click **Next**.

Provide as much information as possible about your case, including the operating environment where you encountered the issue, and the version of the Centrify product you are working with.

A new page appears showing Suggest Knowledge Articles and Technical Resources. You can click **Show More** to see additional resources that might solve your problem.

4. Click **No Thanks, Submit a Case** to open a new case.

Alternatively, you can contact Centrify Support by email or telephone, if you prefer. Worldwide contact information is available in the “How to open a case and collect information for Centrify Support” Knowledge Base article (KB-0301).

Collecting information for support cases

To help ensure your issue gets resolved quickly and efficiently, gather as much information about your working environment as possible.

- Collecting general information about your environment
- Collecting information specific to smart card log in failure
- Collecting information specific to login events

Collecting information specific to smart card log in failure

Collect the following information prior to opening a support case related to smart card log in failure:

- The smart card type (for example, PIV, CAC, CACNG, and so on), manufacturer, and model.
- A screen image of the smart card and its certificates in Keychain Access.
- The following log files:

```
/tmp/sctool_D.log
```

```
/tmp/adquery.log
```

```
/tmp/tokendfolder.log
```

```
/var/centrify/tmp/adinfo_support.tar.gz
```

To generate these logs, run the following commands while logged in as the local administrator:

```
sctool -D > /tmp/sctool_D.log
```

```
adquery user -A username_of_smartcard_user > /tmp/adquery.log
```

```
sudo ls -l /System/Library/Security/tokend/ > /tmp/tokendfolder.log
```

.....

```
sudo adinfo -t
```

Collecting general information about your environment

Take the following steps to gather information about your working environment before opening a support case.

1. Verify that the Centrify agent is running on the computer where you have encountered a problem. For example, run the following command:

```
ps aux | grep adclient
```

If the `adclient` process is not running, check whether the watchdog process, `cdcwatch`, is running:

```
ps aux | grep cdcwatch
```

The `cdcwatch` process is used to restart `adclient` if it stops unexpectedly.

Note The commands in the following three steps must be run as root or with the `sudo` command.

2. Enable logging for the Centrify agent; for example:

```
sudo /usr/local/share/centrifydc/bin/cdcdebug on
```

Note Login events are captured in `/var/log/centrifydc-login.log` by default. Turning on `cdcdebug` captures login events in `/var/log/centrifydc.log`

3. Create a log file for the Mac Directory Service. For example:

- To enable logging for `opendirectoryd`:

```
odutil set log debug
```

- To disable logging for `opendirectoryd` when sufficient log information is collected:

```
odutil set log default
```

4. Duplicate the steps that led to the problem you want to report. For example, if an Active Directory user can't log in to a managed system, attempt to log the user in and confirm that the attempt fails. Be sure to make note of key information such as the user name or group name being used, so that Centrify Support can identify problem accounts more

quickly.

5. Verify that log file `/var/log/centrifdc.log` or `/var/adm/syslog/centrifdc.log` exists and contains data.
6. Run the `cdcdebug` command to generate logs that describe the domain and current environment; for example:

```
sudo /usr/local/share/centrifdc/bin/cdcdebug -f pack
username
```

The following log files are created in `/var/centrifdc/tmp` when you execute the `cdcdebug` command:

- `adinfo_support.tar.gz`
 - `adinfo_support.txt`
 - `cdcdebug.tar.gz`
 - `dump_cache_error.log`
 - `stacktrace.txt`
7. If there is a core dump during or related to the problem, save the core file and inform Centrify Support that it exists. Centrify Support may ask for the file to be uploaded for their review.

If the core dump is caused by a Centrify process or command, such as `adclient` or `adinfo`, open the `/etc/centrifdc/centrifdc.conf` file and change the `adclient.dumpcore` parameter from `never` to `always` and restart the agent:

```
sudo /usr/local/share/centrifdc/bin/centrifdc restart
```

Note For more information about starting and stopping the agent, see the *Administrator's Guide for Linux and UNIX*.

8. If there is a cache-related issue, Centrify Support may want the contents of the `/var/centrifdc` directory. You should be able to create an archive of the directory, if needed.
9. If there is a DNS, LDAP, or other network issue, Centrify Support may require a network trace. You can use `Ethereal` to create the network trace from Windows or UNIX. You can also use `Netmon` on Windows computers.
10. Create an archive (for example, a `.tar` or `.zip` file) that contains all of the log files and diagnostic reports you have generated, and add the archive to your case or send it directly to Centrify Support.

• • • • •

11. Consult with Centrify Support to determine whether to turn off debug logging. If no more information is needed, run the following commands, which must be run as root or with sudo:

```
odutil set log default
```

```
sudo /usr/local/share/centrifydc/bin/cdcdebug off
```

Collecting information specific to login events

Login events are captured in `/var/log/centrifydc-login.log` by default. If you enable logging for the Centrify agent by turning on `cdcdebug`, login events are then captured in `/var/log/centrifydc.log`.

The `/var/log/centrifydc-login.log` grows to a maximum size of 50M before it is compressed. When all compressed `centrifydc-login.log` files combined with the current log file exceed 250M, the oldest compressed log is replaced.

Using sctool

This chapter provides a complete reference to the `sctool` command-line tool. The `sctool` utility is used to enable, disable, and diagnose smart card support. It may also be used to obtain Kerberos credentials from the smart card in the reader.

For additional smart card diagnostic procedures, see [Diagnosing smart card log in problems](#).

Displaying usage information

You can display a summary of usage information for `sctool` by typing the command and the `--help` or `-h` option; for example:

```
sctool --help
```

The usage information displayed is a summary of the valid command line options and required arguments and a brief description of each option.

For more complete information about `sctool`, you can review the information in the command's manual page. For example, to see the manual page for `sctool`:

```
man sctool
```

Understanding sctool

Centrify provides a group policy, **Enable smart card support**, to enable smart card support on Mac computers. This group policy uses the `sctool` utility to add smart card specific strings to the authorization database and to create the `/etc/cacloginconfig.plist` file. In general, you can use the group policy

.....

to enable smart card support. However, the `sctool` utility is also available to specifically configure or diagnose smart card support on any Mac computer.

When you disable smart card support, with the group policy or with `sctool`, the smart card strings are removed from the authorization database and `/etc/cacloginconfig.plist` is deleted.

See [Configuring a Mac computer for smart card login](#) for detailed information about using group policies to enable smart card login and screen locking.

Note When you enable or disable smart card support with `sctool`, the change is temporary, unless the group policy, Enable smart card support, is not configured. For example, if the policy is set to enable smart card support, and you disable it with `sctool`, at the next reboot the policy takes effect and smart card support is re-enabled. If the policy is not configured, you can control smart card support on individual computers using `sctool`.

Synopsis

```
sctool  -e --enable
        -d --disable
        -s --status
        -u --update-upn-map [mapping]
        -D --dump
        -S --support
        -c --clearcrls
        -r --revokecheck

        Extra options for -r:
            -t --type [ocsp|crl]:[none|best|cert|all]
            -p --priority [ocsp|crl|both]
            -l --localocsp [ocsp server url]
        -k --pkinit userPrincipalName
        -a --altpkinit unixname
        -E --no-eku
        -K --check-kdc-eku
```

.....

```
-L --lock-status  
-o --sudo enable | disable
```

Setting valid options

You can use the following options with this command:

Note You may specify only one option at a time when running `sctool`.

Use this option	To do this
<code>-e, --enable</code>	Enable smart card support by making necessary edits to the authorization database, and by creating the <code>/etc/cacloginconfig.plist</code> file.
<code>-d, --disable</code>	Disable smart card support by removing smart-card specific strings from the authorization database, and by deleting <code>/etc/cacloginconfig.plist</code> .
<code>-s, --status</code>	Show whether smart card support is enabled or disabled. This option outputs one of these two messages: <ul style="list-style-type: none">▪ “Centrify SmartCard support is enabled” (then exits with status 0).▪ “Centrify SmartCard support is disabled” (then exits with status 1).
<code>-u --update-upn-map [mapping]</code>	This option specifies a field of the smart card certificate to be used as the UPN search value. [mapping] denotes the preferred field to be used to override the default field (NT Principal Name) of the smart card certificate.
<code>-D, --dump</code>	Display information about the system setup and about any smart cards that are attached to the computer. For each card, this option lists the type of card and any summary information. It also enumerates all identities on the card and lists the following for each: <ul style="list-style-type: none">▪ Subject name▪ UPN (if present)▪ Whether the card is trusted▪ Data signing success or not▪ Signature verification

Use this option	To do this
<code>-S, --support</code>	Lists the same information as the <code>--dump</code> option and additionally lists the state of the system configuration files.
<code>-c --clearcrls</code>	Removes all CRLs from the keychain.
<code>-r --revokecheck [-t] [-p] [-l]</code>	Extra options:
	<code>-t, --type [ocsp crl]:[none best cert all]</code>
	Change certificate validation setting for method [ocsp crl] to [none best cert all].
	ocsp :
	Online Certificate Status Protocol.
	crl :
	Certificate Revocation List.
	none :
	No revocation checking is performed.
	best :
	The certificate passes unless the server returns an indication of a bad certificate. This setting is best for most circumstances.
	cert :
	If the URL to the revocation server is provided in the certificate, this setting requires a successful connection to a revocation server and no indication of a bad certificate.
	Use only in a tightly controlled environment that guarantees the presence of a CRL server or OCSP responder. If a CRL server or OCSP responder is not available, SSL and S/MIME evaluations could fail to respond.
	all :
	This setting requires successful validation of all certificates. Use only in a tightly controlled environment that guarantees the presence of a CRL server or OCSP responder.
	If a CRL server or OCSP responder is not available, SSL and S/MIME evaluations could fail to respond.
	<code>-p, --priority [ocsp crl both]</code>

Use this option	To do this
	<p>This setting determines which method <code>[ocsp cr1 both]</code> is attempted first. If the first method chosen returns a successful validation, the second method is not attempted.</p>
	<p><code>-l, --localocsp [ocsp server url]</code></p> <p>This setting overrides the OCSP server URL of certificate with <code>[ocsp server url]</code></p>
<code>-E, --no-eku</code>	<p>Allow <code>sctool</code> to obtain Kerberos credentials even though the client certificate does not have the extended key usage attribute. This parameter must be used with the <code>-k (--pkinit)</code> parameter or the <code>-a (--altpkinit)</code> parameter.</p>
<code>-K --check-kdc-eku</code>	<p>Enables checking of the KDC certificate for the Extended Key Usage (EKU) extension "Kerberos Authentication". Do not use this option if you have not updated your KDC to include the required EKU. Enable EKU checking after updating your KDC certificate.</p> <p>EKU checking is disabled by default.</p> <p>This parameter must be used with the <code>-k (--pkinit)</code> parameter or the <code>-a (--altpkinit)</code> parameter</p>

Use this option	To do this
<code>-k, --pkinit userPrincipalName</code>	<p>Obtain Kerberos credentials from the smart card currently in the reader and store them in the user's cache.</p> <p>This option obtains a ticket granting ticket (TGT) using the public/private key pair stored on the smart card, which is intended to be used in the same manner as the <code>kinit(1)</code> command: to obtain or renew credentials when they are not handled automatically (such as a long login session during which the user does not lock the screen saver), or for troubleshooting. In normal usage you should never need to run <code>sctool --pkinit</code>.</p> <p>To obtain kerberos credentials, <code>sctool</code> must find a certificate that matches the user, is valid for smart card login, is not expired or revoked, and is trusted by the domain. There are several ways to specify how the certificate should be found (note that only one of these options is used; <code>sctool</code> does not try the later options if an earlier option fails to find a certificate):</p> <ul style="list-style-type: none"> ■ If a UPN is specified on the command line, the user's keychains and the smart card in the reader (if any) are searched for a valid certificate that matches that UPN. ■ If no UPN is specified on the command line, and the <code>CDC_SMARTCARD_TOKEN</code> environment variable is set, the smart card named in the environment variable is searched for a valid certificate. The NT Principal Name attribute of that certificate is used as the UPN. ■ If the <code>USER_PRINCIPAL_NAME</code> environment variable is set, a certificate that matches that UPN is searched for in the same manner as in the first option. ■ If none of the above command-line options or environment variables are set, the <code>sctool</code> looks up the user in AD to obtain the UPN, and searches for a matching certificate in the same manner as in the first option.

Use this option	To do this
	<p>While <code>sctool --pkinit</code> can use certificates that are stored in an on-disk keychain rather than a smart card, only use with a smart card is officially supported.</p> <p>If no suitable certificate is found, <code>sctool</code> prints an error and exits with status 1. Otherwise, it checks whether the computer is operating in disconnected mode. If so, <code>sctool</code> immediately exits with status 2, since Kerberos tickets cannot be obtained in disconnected mode. This allows the authorization mechanism to permit smart card login in disconnected mode, while still verifying that the certificate on the smart card is valid and trusted.</p> <p>If the computer is connected to the domain, <code>sctool</code> contacts the domain controller to obtain a TGT using the associated private key. If this fails, <code>sctool</code> prints an error and exits with status 1.</p> <p>If the user's password has expired, <code>sctool</code> may be unable to retrieve a TGT and will issue the message:</p> <pre>krb5_get_init_creds_pkinit failed: Password has expired</pre> <p>To resolve this issue, edit the user's ADUC Properties page by clicking the Account tab and checking one or both of the following options:</p> <p>Account option: Smart card is required for interactive login</p> <p>Password never expires.</p>
<code>-a --altpkinit unixName</code>	Obtain Kerberos credentials from a multi-user smart card currently in the reader and store them in the user's cache. Because the card is configured for multiple accounts, the user is prompted to enter the user name, which the command uses to retrieve the Kerberos credentials.
<code>-L --lock-status</code>	<p>Show the smart card lock status for all connected smart cards. Possible values are:</p> <ul style="list-style-type: none"> ■ No smart card inserted ■ Authentication attempts remaining: ■ Card is locked
<code>-o --sudo enable disable</code>	

• • • • •

Examples

Display information about the smart cards attached to the computer:

```
#sudo sctool -D
```

Password:

Enable smart card support:

```
#sudo sctool -e
```

Password:

Installing and removing the agent and leaving a domain

This appendix shows other methods of installing the agent besides the standard method using the package installer (DMG file); see [Installing the Centrify agent](#). It also shows how to remove the agent and how to join and leave a domain.

This appendix contains the following topics:

- [Installing using the install.sh script](#)
- [Installing silently on a remote computer](#)
- [Leaving an Active Directory domain](#)
- [Uninstall from the Centrify System Preferences pane](#)
- [Run the Centrify uninstall.sh script](#)

Installing using the install.sh script

This section explains how to install using the `install.sh` script. This method is recommended for experienced UNIX administrators who are familiar with UNIX command-line installations. Otherwise, you should install by using the graphical user interface, which is described in [Installing the Centrify agent](#).

To install using the `install.sh` command-line program:

Note Before launching the installer, be certain that Apple Directory Utility is closed. If it is open while running the installer, it causes the Centrify Directory Access plug-in to show the incorrect status, that is, it shows that the plug-in is disabled when in fact it is enabled.

1. Log on with a valid user account.

Note You are not required to log on as the root user on, but you must know the password for the Administrator account to complete the installation.

2. Mount the CD-ROM device using the appropriate command for the local computer's operating environment, if it is not automatically mounted.
3. Change to the appropriate directory on the CD or on the network where the Centrify agent package is located. For example, change to the Agent_Mac directory.
4. Run the `install.sh` script to start the installation of Centrify on the local computer's operating environment. For example:

```
sudo ./install.sh
```

Before beginning the installation, the `install.sh` script runs the `ADCheck` utility, which performs a set of operating system, network, and Active Directory checks to verify that the Mac computer meets the system requirements necessary to install the Centrify agent and join an Active Directory domain.

5. Review the results of the checks performed. If the target computer, DNS environment, and Active Directory configuration pass all checks with no warnings or errors, you should be able to perform a successful installation and join. If you receive errors or warnings, correct them before proceeding with the installation.
6. Follow the prompts displayed to select the services you want to install and the tasks you want to perform. For example, you can choose whether you want to join a domain or restart the local computer automatically at the conclusion of the installation.

When installation is complete, see [Understanding the directory structure](#) for a description of the directories and files installed for Centrify.

Installing silently on a remote computer

You can install the agent silently on a remote Mac computer in either of these ways:

- By using `sudo` commands from the command line. If you use this method, no user interaction on the target Mac computer is required. See [Installing remotely on a Mac computer using `sudo` commands](#) for details about using this method to install the agent remotely.
- By using Apple Remote Desktop. This method requires that you have Apple Remote Desktop 3 for remote software distribution. See [Installing remotely on a Mac computer using Apple Remote Desktop](#) for details about using this method to install the agent remotely.

If you use this method to install version 5.1.0 of the agent, the Centrify Join Assistant launches on the target Mac computer after the installation completes, and a user must interact with the Centrify Join Assistant to complete the join process. This limitation exists only in version 5.1.0 of the agent. Earlier versions of the agent (that is, 5.0.x and lower) and later versions (5.1.1 and above) do not have this limitation, and can be installed using Apple Remote Desktop without any user interaction on the target Mac computer.

Installing remotely on a Mac computer using `sudo` commands

Perform the following steps to use `sudo` commands to install the agent remotely on a target Mac computer without requiring any user interaction on the target Mac computer.

1. Ensure that you have administrator account credentials on the target Mac computer, and that SSH is installed on the target Mac computer.
2. On the computer where the Centrify packages were downloaded (that is, the source computer), use an appropriate file transfer method to push the `centrifyDC-x.x.x.pkg` file to the target Mac computer.

For example, perform these steps to transfer files from a PC source computer to the target Mac computer:

- a. On the source computer, ensure that file sharing is enabled, and that the folder containing the Centrify packages is a shared folder.
- b. On the target Mac computer:
 - Open a new window in the Finder.
 - In the sidebar under **Shared**, click **All**.

- Select the source computer.
 - Click **Connect As**, type the user name and password for the source computer, and click **Connect**.
- c. The folder that you shared on the source computer appears in the Finder on the target Mac computer. Locate the `CentrifyDC-x.x.x.pkg` file on the source computer and drag it to the location of your choice on the target Mac computer.
3. On the source computer, use a program such as Putty to connect remotely to the target Mac computer through SSH. Log in to the target Mac computer using an account that has local administration privileges, such as the Local Admin account.
 4. On the target Mac computer, navigate to the directory where the `.pkg` file was transferred and execute the following command:

```
sudo /usr/sbin/installer -pkg CentrifyDC-x.x.x.pkg -target /
```

When you execute this command, the agent is installed silently on the target Mac computer.

- If an agent was already installed on the target Mac computer and this was an update of the existing agent, the target Mac computer was already joined to the domain, and you do not need to perform any additional steps.
 - If this was the first installation of the agent on the target Mac computer, you must enable licensed features and join the target Mac computer to a domain as described in Step 5 and Step 6.
5. Execute the following command on the target Mac computer to enable licensed features:

```
sudo adlicense -l
```

6. When you join the target Mac computer to a domain, you can choose to join the auto zone or a specified hierarchical zone.
- Execute the following command on the target Mac computer to join the target Mac computer to a domain and the Auto Zone:

```
sudo /usr/local/sbin/adjoin --user Domain_Admin --container "domain.com/Path/To/OU" --name computer_name --workstation domain_name.com
```

- Alternatively, execute the following command on the target Mac computer to join the target Mac computer to a domain and a specified hierarchical zone:

```
sudo /usr/local/sbin/adjoin --user Domain_Admin --
container "domain.com/Path/To/OU"
--name computer_name --zone zone_namedomain_
name.com
```

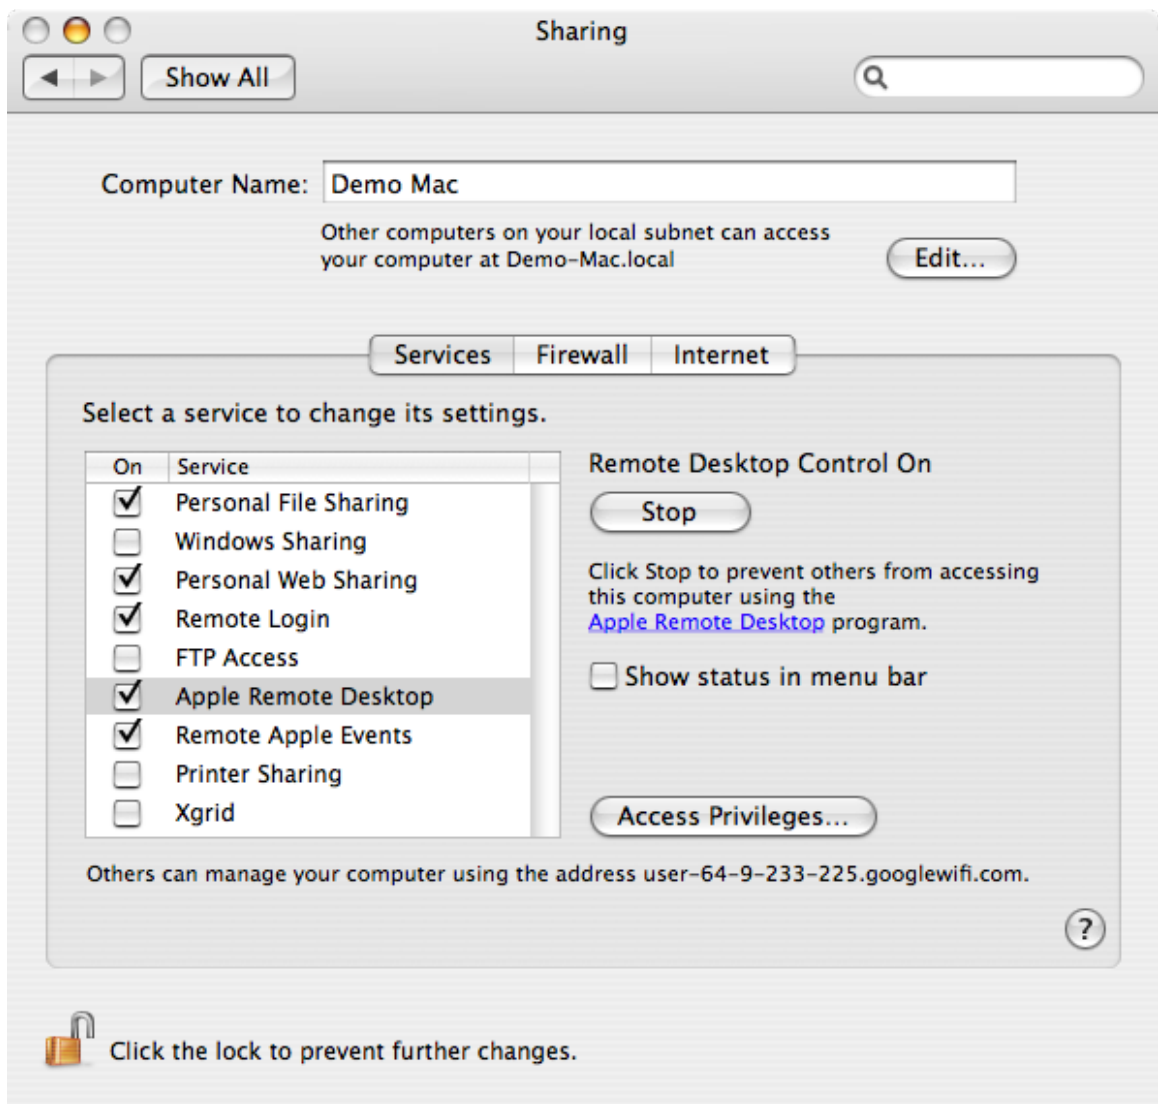

Installing remotely on a Mac computer using Apple Remote Desktop

Perform the following steps to install the agent remotely on a target Mac computer without requiring any user interaction on the target Mac computer.

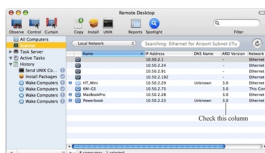

Note If you use this method to install version 5.1.0 of the agent, the Centrify Join Assistant launches on the target Mac computer after the installation completes, and a user must interact with the Centrify Join Assistant to complete the join process. For all other versions of the agent, no user interaction on the target Mac computer is required.

To remotely install the Centrify agent and join a computer to the domain using Apple Remote Desktop 3:

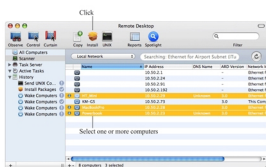

1. Verify that you have an Apple Remote Desktop 3 Admin station and one or more Apple Remote Desktop 3 Clients.
2. Verify that all of the Apple Remote Desktop 3 Client computers where you want to install the Centrify agent are set to **Allow Remote Desktop** using the Service pane in the Sharing system preference. For example:

3. Copy the Centrify agent package, for example `centrifydc-release-macversion-i386.dmg`, to the Apple Remote Desktop 3 Admin computer and verify that you can access the disk image.
4. Open Remote Desktop on the Admin Computer, then click **Scanner** and verify that the Mac computers on which you plan to install Centrify are listed and that ARD Version column displays 3.0 (or later). For example:

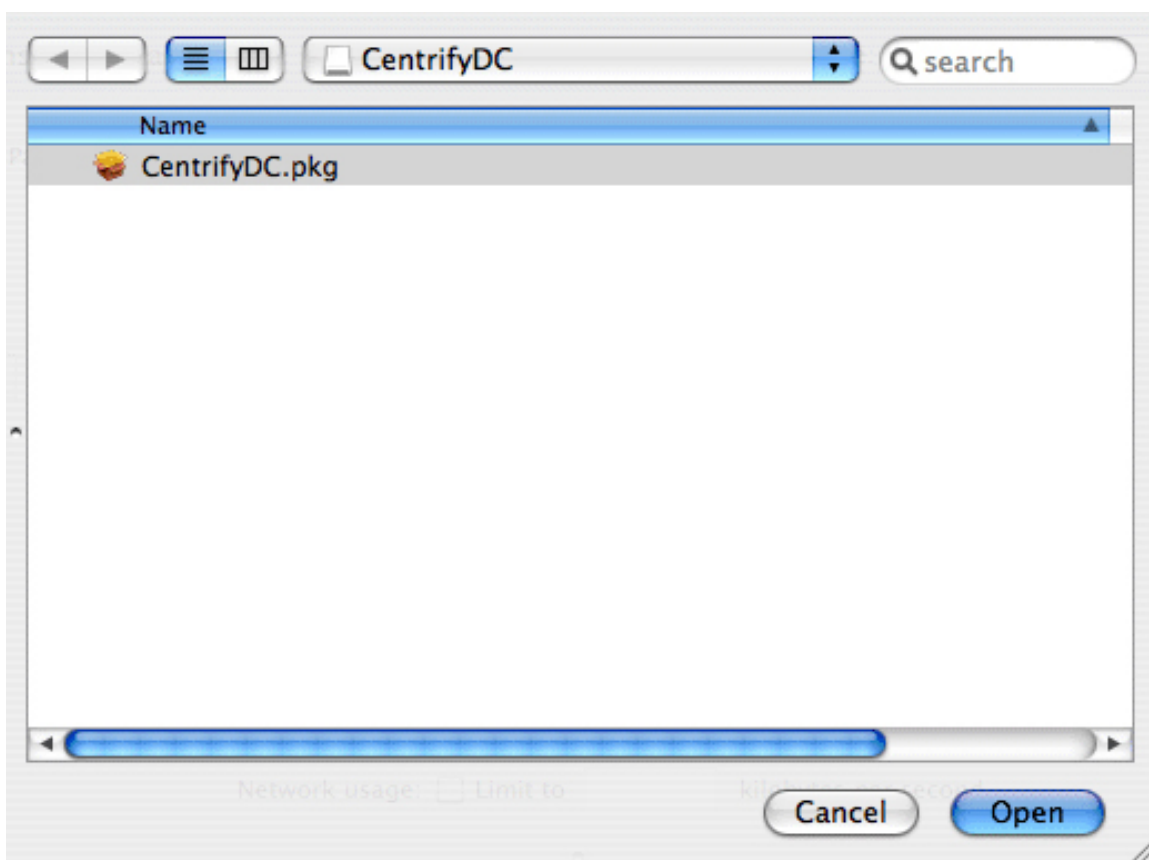

5. Select one or more computers from the list, then click **Install**. For example:

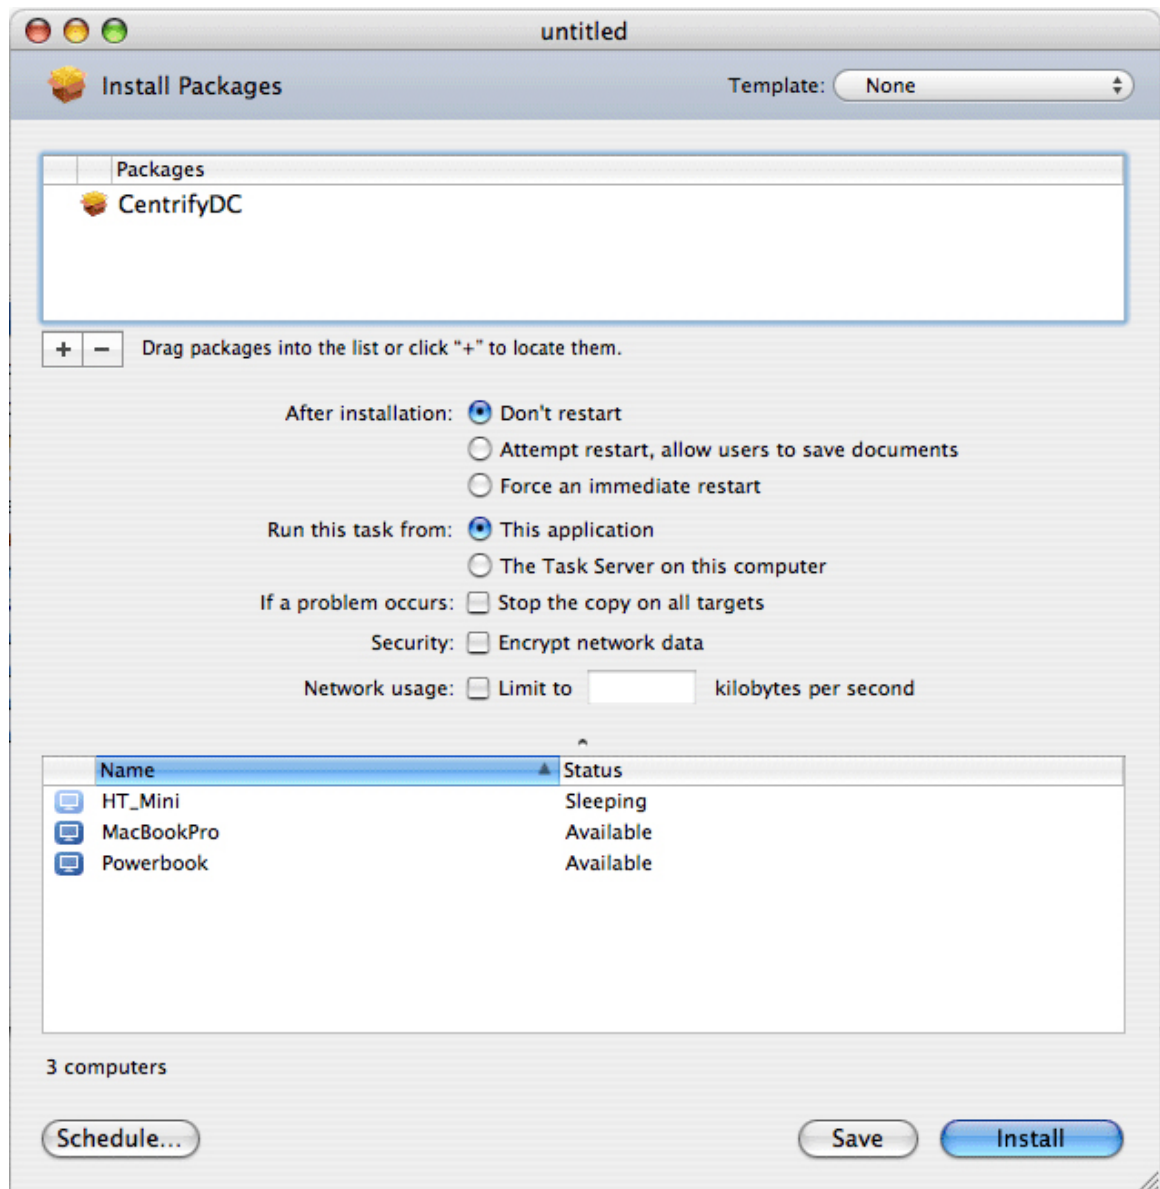

6. In the Install Packages window, click **+** to locate the `centrifydc.pkg` in the Centrify agent disk image. For example:

7. In the Centrify agent disk image, select the `centrifydc.pkg` file and click **Open** to add it to the Install Packages list. For example:

8. In the Install Packages window, click **Install** to install the listed packages, For example:

In most cases, you can use the default settings to install the Centrify agent. If you want to schedule the installation for another time rather than completing the installation now, click **Schedule**. For more information about the Apple Remote Desktop installation parameters, see Chapter 8 “Administering Client Computers,” in the Apple Remote Desktop Manual.

If you click Install the Remote Desktop displays a progress bar and task status for each of the computers selected for the installation.

Understanding the directory structure

When you complete the installation, the local computer will be updated with the following directories and files for Centrify:

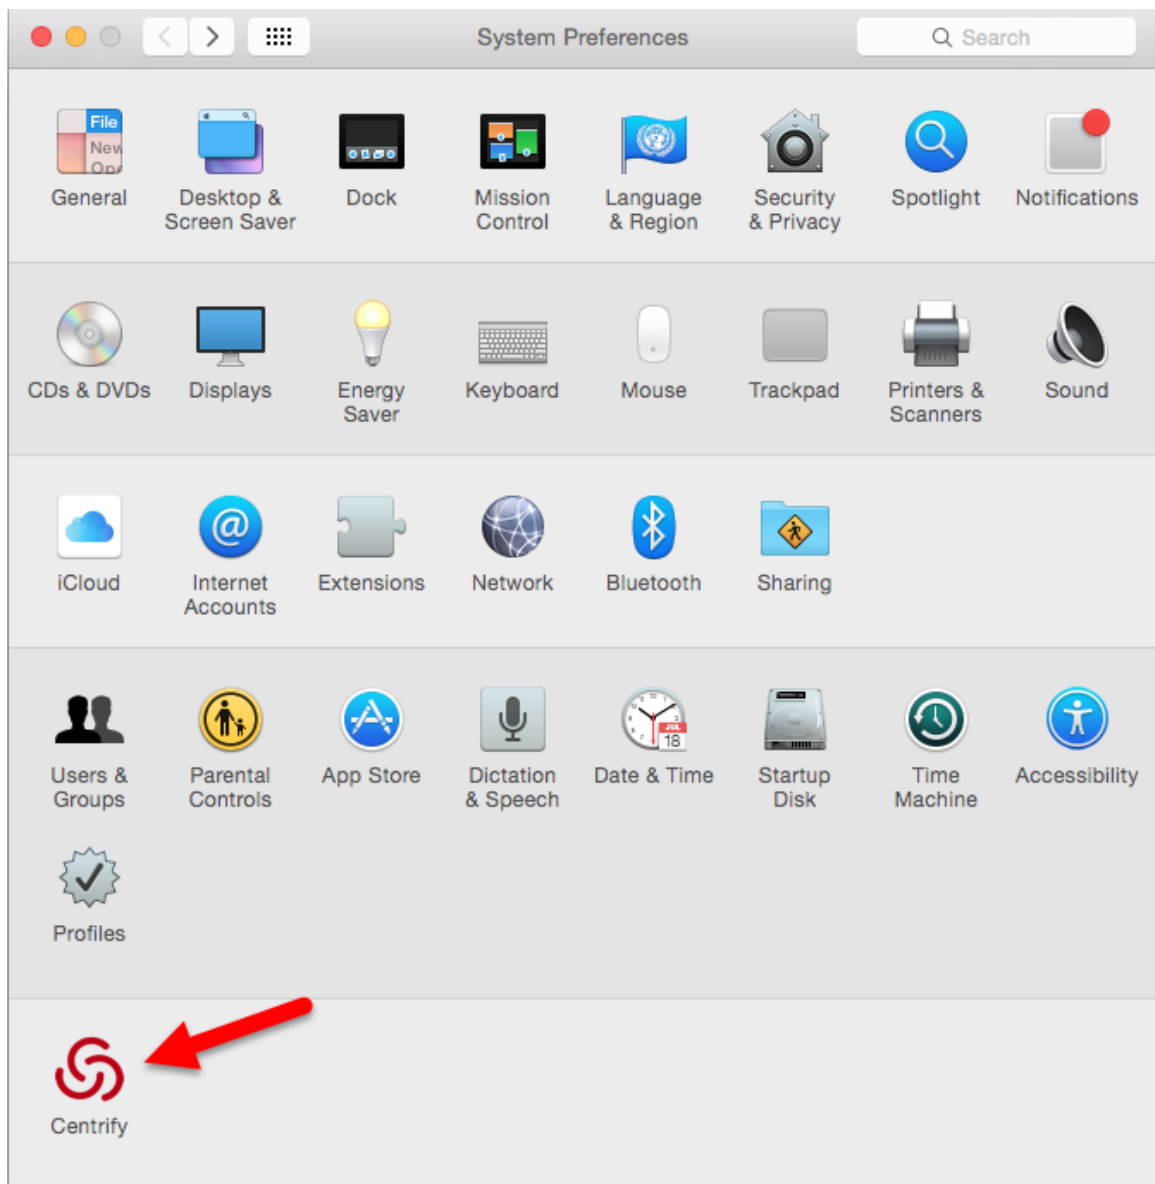

This directory	Contains
/etc/centrifydc	The Centrify agent configuration file and the Kerberos configuration file.
/usr/local/share/centrifydc	Kerberos-related files and service library files used by the Centrify agent to enable group policy and authentication and authorization services.
/usr/local/sbin /usr/bin	Command line programs to perform Active Directory tasks, such as join the domain and change a user password.
/var/centrifydc	No files until you join the domain. After you join the domain, several files are created in this directory to record information about the Active Directory domain the computer is joined to, the Active Directory site the computer is part of, and other details.
/System/Library/Frameworks/DirectoryService.framework/Resources/Plugins	The Centrify Directory Service Plugin, CentrifyDC.dsplug, that enables you to join or leave the domain using the graphical user interface.

Uninstall from the Centrify System Preferences pane

The Centrify System Preferences pane is created when you install the Centrify agent for Mac. You can use this pane to uninstall the Centrify agent. Uninstalling the agent from the Centrify System Preferences pane also leaves the AD domain.

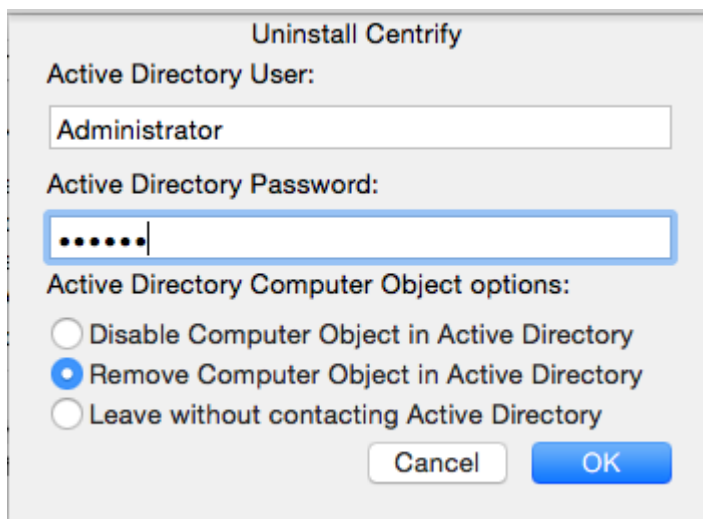

To uninstall the Centrify agent from the Centrify System Preferences pane

1. Open **System Preferences**, then click **Centrify**.

2. Click **Uninstall**, then click **OK** at the confirmation prompt.

The Uninstall Centrify window appears, prompting for administrator credentials and a decision on what to do with the computer object when you leave the AD domain. See [Leaving an Active Directory domain](#) for more information about leaving an AD domain.

3. Enter administrator credentials and select an option for leaving the AD domain, then click **OK**.

The uninstall process starts.

4. Click **OK** to quit when you see the window indicating that the Centrify Agent was uninstalled.

Run the Centrify uninstall.sh script

The `uninstall.sh` script is installed by default in the `/usr/local/share/centrifydc/bin` directory on each Centrify-managed system.

To remove the Centrify agent on a Mac computer by running the `uninstall.sh` script

1. Open a Terminal window on the computer where the Centrify agent is installed. For example, select **Applications > Utilities > Terminal**.
2. Switch to the root user or a user with superuser permissions. For example:

```
su -
```

Password: *root_password*

3. Run the `uninstall.sh` script. For example:

```
/bin/sh /usr/local/share/centrifydc/bin/uninstall.sh
```

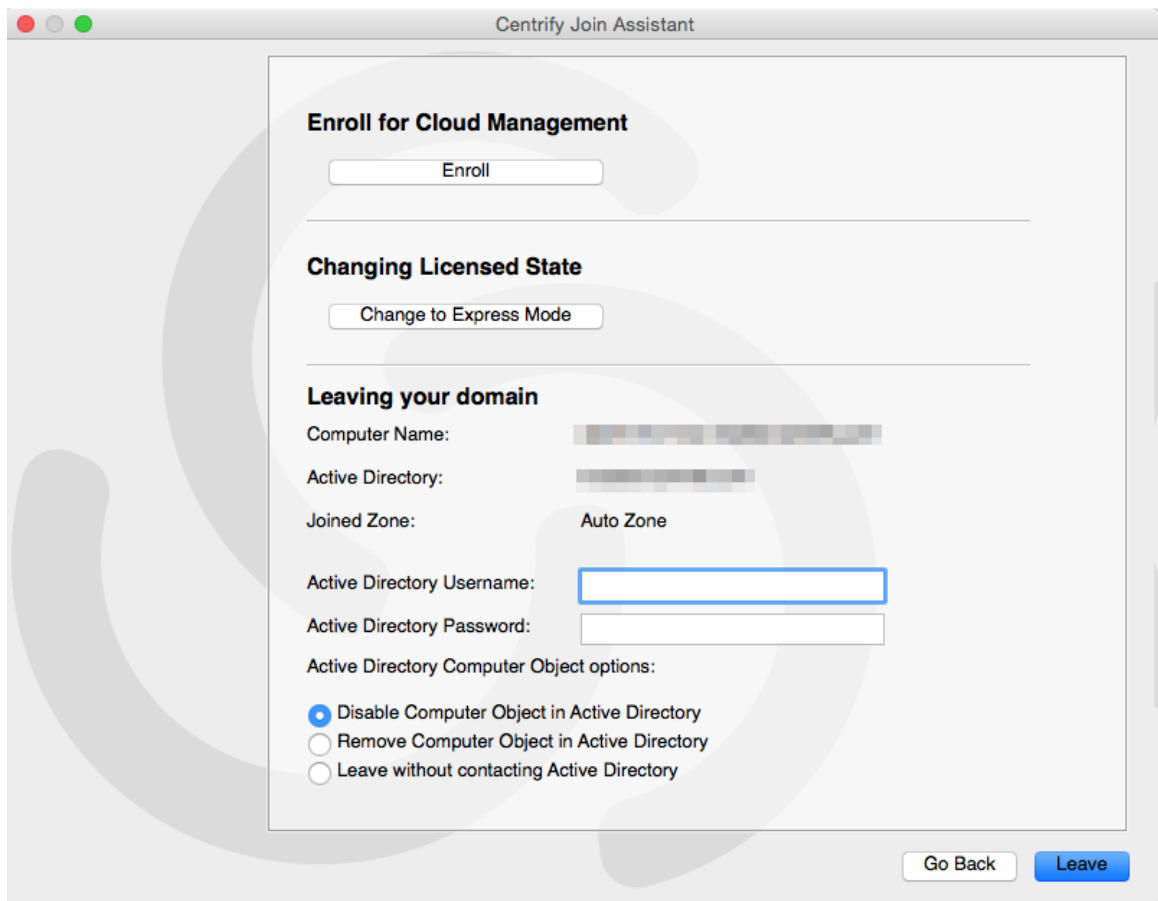

The `uninstall.sh` script will detect whether the Centrify agent is currently installed on the local computer and whether the computer is currently joined to a domain. If the computer is not currently joined to a domain, the script will begin removing Centrify files from the local computer.

Leaving an Active Directory domain

To start the Centrify program for joining or leaving a domain:

1. Click **Applications > Utilities > Centrify**, then double-click **Centrify Join Assistant** to open it.

Click **Continue** on the Welcome page and the join assistant displays information about the domain to which the computer is connected:

The screenshot shows the 'Centrify Join Assistant' window. It has three main sections: 'Enroll for Cloud Management' with an 'Enroll' button, 'Changing Licensed State' with a 'Change to Express Mode' button, and 'Leaving your domain'. The 'Leaving your domain' section displays the following information: 'Computer Name:' followed by a blurred text, 'Active Directory:' followed by a blurred text, 'Joined Zone:' with 'Auto Zone' selected. Below this are input fields for 'Active Directory Username:' and 'Active Directory Password:'. At the bottom of this section are three radio button options: 'Disable Computer Object in Active Directory' (which is selected), 'Remove Computer Object in Active Directory', and 'Leave without contacting Active Directory'. At the bottom right of the window are 'Go Back' and 'Leave' buttons.

2. Select whether to disable the computer object in Active Directory, remove the computer object from Active Directory, or leave without contacting Active Directory.

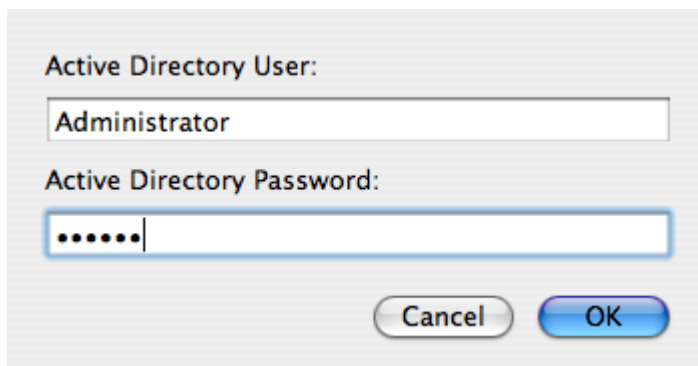

- **Disable:** Disables the computer object in Active Directory.
- **Remove:** Removes the computer object from Active Directory.
- **Leave without contacting Active Directory:** This option forces the local computer's settings to their pre-join conditions without contacting Active Directory. The Computer Object will not be removed or disabled in Active Directory.

Use this option if the Active Directory computer account has been modified or deleted so that the host computer can no longer work with it.

3. Click **Leave** to leave the domain.

The **Enroll** button is displayed unless the computer is already joined to the identify platform. You can ignore this option when leaving the domain.

4. Type the Active Directory user name and password for a user with permission to remove the local computer from the Active Directory domain, then click **OK**.

5. Type the user name and password for the local Administrator account.
